The Chicago City Railway has in contemplation the building of 40 miles of new single track electric road, or 20 miles of double track. Judging by past experiences the cost of this road will be $7,500 a mile for single track, or for the entire 40 miles there will need to be expended in the neighborhood of $300,000. The company is not in a position where it will need to go into the market for this money. It has no floating debt at the present time, but, instead, has a surplus. There was issued in July of the present year $1,000,000 in stock, which was sold at par to stockholders, and the proceeds of this sale have paid for all the extensions that had been made up to the time of the stock issue. The road is earning 18 per cent. a year upon its capitalization of $10,000,000, or $1,800,000 a year. It pays annual dividends of 12 per cent. upon its capital, or a total of $1,200,000, leaving a surplus of $600,000 a year. This surplus will be sufficient to pay for all the electrical extensions that are in contemplation. It is not probable, therefore, that any of the money to be derived from the sale of the $2,000,000 of new stock, which the board has asked the authority to issue, will be used for any extensions that are in prospect. It is believed by those who are familiar with the situation that the stock issue is intended to be used toward the retirement of the present outstanding issue of bonds, which amounts to $4,619,500. There is no other need apparent to which the $2,000,000 could be put.

President Wheeler said yesterdayit was not determined how this money was to be expended. He said there was a considerable amount of new electric line to be built, and that money would be needed for this. He did not deny that the bonds of the company might be retired in part. He did deny, however, that there was any truth in the report that he would retire from the presidency of the company at the end of the present year.—*Chicago Tribune.*

Prophetstown, Ill., has contracted to build and operate an electric light system for a term of 20 years.

The project of a direct electric road from Cohoes, N. Y., to Albany is now said to be an assured success.

The report of Albert F. Schock, receiver of the Ottawa, Ill., Electric Street Railway company, was filed in the Federal court on December 6th concerning the sale of the property under the foreclosure of the Mercantile Trust company's $75,000 mortgage. He recommended the acceptance of the $7,500 bid of the General Electric company.

## Lombard Hydraulic Brake.

A new hydraulic brake for use on electric cars is shown by the illustrations. Fig. 1 shows the box, which is about 30 inches long, 12 inches wide and eight inches deep, containing the piston and pump cylinders connected with the pressure tank, which is about 38 inches long and six inches in diameter, the whole apparatus weighing about 150 pounds. The box may be placed anywhere under the car floor where the sprocket wheel can be connected with the axle to get power to drive the pump. The tank may be placed anywhere that can be reached by piping to connect both sides of it to box containing the brake and pump cylinders,

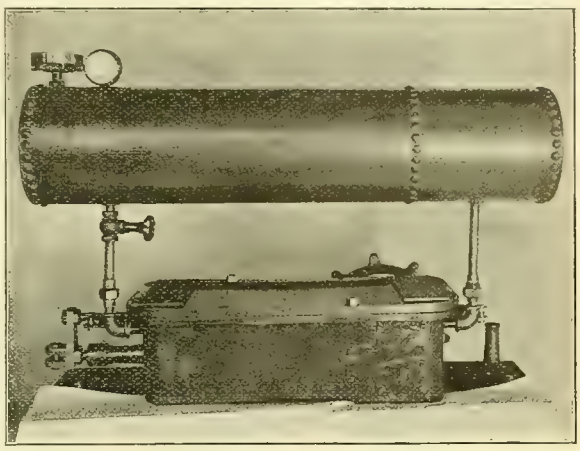

FIG. 1. LOMBARD HYDRAULIC BRAKE.

preferably under the seats of the car. This tank is partitioned into two chambers; the larger chamber is filled two-thirds full of oil and is charged with air compressed to about 220 pounds pressure. The smaller chamber is practically a vacuum. A safety valve is placed on the pressure end of the tank. The pressure gauge may be place anywhere on the car.

In Fig. 2 is shown the brake cylinder and pump arrangement of the valve operating mechanism. It will be observed that the shaft, having a small crank at one part of it driven by the sprocket wheel and chain from the axle, is connected to the piston rod of the pump by means of a fork connecting rod, giving a reciprocating motion to the piston. The piston and valves are so arranged as to make it a single acting pump. The brake operating piston, the larger of the two having a rod projecting outside of the casing, is so arranged as to receive the brake chain coupling. Any movement of the piston will operate the brake lever and so set the brakes of the car. It is also connected with the valve by a rod. This piston and rod may travel 10 inches, and is 2½ inches in diameter, taking 18.84 cubic inches of oil, or about one pint, to fully extend the brake rod. Another rod operates the three-way valve which controls the setting or releasing of the brake, and is operated by a handle at either end of the car. Pipe connections make a closed circuit for the fluid to pass from the pressure tank through the brake piston, setting the brake and exhausting into the vacuum, then being pumped back into the pressure tank by a few strokes of the pump through channels in the pump castings and pipe, thus continually maintaining the

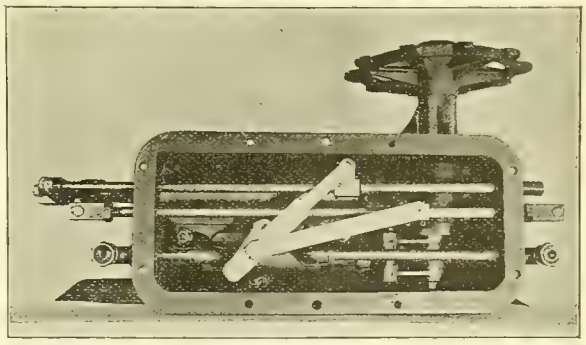

FIG. 2. LOMBARD HYDRAULIC BRAKE.

pressure and vacuum, the piping being so arranged that oil, and never air, enters the brake cylinder. The iron casting is partly filled with lubricating oil and closed tightly, thus continually lubricating all parts needing it.

The power stored in this pressure tank consists of an elastic air cushion of 220 pounds pressure and an inelastic fluid, which in this case is preferably oil. In operation this fluid is used as a medium to transmit the stored energy of the air pressure from the tank to the brake operating piston. Any movement of this piston will operate the brake lever and set the brakes of the car. To operate this brake piston the pipe running from the three-way valve sup

plies the fluid under pressure to move the piston, all in accordance with the opening of the three-way valve, which may be set at will by the operator. A compensating lever mechanism, shown in Fig. 2, will set the fluid valve so that the large piston can be held at any position or part of its stroke; that is to say, the piston can be moved forward to put the stroke on light or heavy or at any point desired and hold it there. The same three-way valve also regulates the release in the same way and controls the throwing off of the brake shoes, so that the brake can be held at any grade of tightness desired and is under the entire control of the operator. As before stated, the oil is merely a medium of transmitting the power from the pressure tank to the operating brake piston and from the force pump back to the pressure tank to restore the energy consumed. In this case the pump shaft only has to make four or five revolutions to return to the pressure tank all the oil used in its operation.

The discharge of this hydraulic brake is also worthy of consideration. It is entirely noiseless; in fact, discharging into the vacuum tank, the exhaust or discharge of the brake is instantaneous, although under full control of the operator, as the least movement of the handle changes the valve and the direction of the movement of the oil.

The use of oil, an inelastic fluid, for transmitting the power, gives several advantages to this brake not possessed by any other braking device: First, ease of maintaining the pressure; the compressed air does not leak out. Second, the simplicity of its operation; any man who knows enough to operate the hand brake will control the car better with this brake on his first trip than he can with the old brake, because the least movement of his handle is instantly answered by the quantity of oil behind the brake piston, and consequently the amount of pressure of the shoes on the wheels. In going down grade he can ease off a less amount of pressure than by any other brake, controlling his speed absolutely. In making a start on an up grade the same facility enables him to hold the car at just the point at which the wheels would begin to revolve; then applying the power the easy release of the brake allows the starting without a hitch or jerk. He can make the ordinary stops in about one-half the time or distance that he can by his hand brake, and make his trip in 10 per cent. better time. The same facility to ease off his brake a little and still hold, if he sets it harder than necessary, prevents the skidding of the wheels. For an emergency stop his natural way is, as in ordinary stops, simply to pull the handle, opening the three-way valve and the whole force is instantly applied and stays on, even if the motorman jumps. The controlling rod is so placed that a collision would tend to open the valves and set the brakes. Emergency stops have been made in six feet.

This brake is manufactured by the Lombard Water Wheel Governor company, 61 Hampshire street, Boston.

## British Telegraph Service Losing Money.

The latest report of the postmaster-general of England shows that the annual deficit of the telegraph service goes from bad to worse. In seven years the loss amounts to nearly $13,000,000, and this, in spite of, or perhaps because of, a good increase in the business done. To put it bluntly the English telegraphs are bankrupt and are only kept up by heavy drains on the national purse. There are now 9,661 telegraph offices in the United Kingdom, and the number of messages has reached 71,589,064 per year, or an average per head of population somewhat larger than our own, though by no means evincing the rapid acceleration seen in the use of the telephone. In this country there are now 10 times as many telephone conversations exchanged as there are telegrams sent each year; but in all England there are only 60,000 exchange telephones, so that the telephone has not yet begun to act as a serious check on telegraphic expansion and revenue. Yet it is already noticed in London that the more general use of the telephone has kept down the increase in the number of telegrams to about 250,000. A very interesting feature of the English work is that during the year 19 additional shore lighthouses and light stations have been connected with the network, while cables have been laid to two lightships and one lighthouse rock.

The Leijkam-Josefthal (Austria) paper mill, which was destroyed last spring during an earthquake, has now been rebuilt, and extensive use has been made of electricity in the fitting up of the mill. The water power of a river some two miles distant has been employed, and a generating plant of 500 horse power has been erected. This plant consists of two turbines of 250 horse power each, driving on to a common countershaft, to the two ends of which two "drehstrom" generators of 250 horse power each are coupled. These machines are of the Ganz type, and give an electromotive force of 3,000 volts when running at 170 revolutions per minute. The current is taken to the mill by three overhead conductors, where it is transformed to 300 volts. The loss in the conductors is about 5½ per cent. At the mill a third generator of 250 horse power of the same type has been provided, but working at only a potential of 300 volts. This machine will be used as a supplementary one. From a main switchboard the "drehstrom" is distributed to various motors which drive the mill shaftings and the special machinery. There are motors of a capacity ranging from 160 horse power to three horse power. A continuous current dynamo for lighting purposes is driven off the main shaft.

# CORRESPONDENCE.

## New York Notes.

NEW YORK, December 7.—Some interesting testimony was offered yesterday at the Hotel Metropole before the Assembly committee appointed to inquire into the physical and fiscal condition of the street railways of this city. Secretary L. L. Delafield of the Board of Rapid Transit Commissioners, in answer to the question, "How much money have the commissioners expended since 1894?" replied: "The total amount appropriated is $61,775.86, and we have expended of that between $56,000 and $59,000—the exact figures I have not with me." Commissioner John H. Inman was asked:

"Do you favor municipal ownership at all, unless in a large enterprise like this, which private capital will not undertake? Do you favor the municipality operating a railway?"

"No, sir; I do not. I would sublet it to a private company."

Mr. Inman stated that as a general principle he did not favor state ownership, but he thought the present Rapid Transit act was all right. He also stated that the Board of Rapid Transit Commissioners was ready to give reasonable concessions to the elevated railway for the purpose of securing rapid transit if proper application was made.

Mr. Steinway, another of the Rapid Transit commissioners, was called. Mr. Steinway said that he thought that the building of an underground road was the best thing that the city could do for its interests.

"The underground railway," said he, "will not cost $50,000,000 to build, and in 40 years the city will own it completely, without paying a cent. It will be the best thing the city ever did."

"Do you believe in municipal ownership in general?"

"No, sir; I am opposed to municipal ownership in general because I believe it would build up a corrupt political machine and be the refuge of political hacks."

Mr. Steinway said he was opposed to the city operating railways. He also said that the new underground railway in London was a great success, with only one drawback, that the elevators carrying passengers down to the road 95 feet under ground were not adequate to the demand. The use of electricity would remove all the unpleasant features of underground travel.

Mr. Steinway then corroborated Mr. Inman's statement that the board stands ready to listen to any propositions the elevated road may submit.

William Barclay Parsons, chief engineer to the commission, next took the stand. He submitted some of his reports, and said that the building of an underground railway was perfectly feasible from an engineering point of view.

"There is no great engineering difficulty," said he, "in the building of the road, but there is a vast amount of detail. The cable road will not be interrupted for a moment."

Chairman Nixon announced that the committee had finished its labors in New York, and an adjournment was taken to meet at Albany on Monday morning.

Judge Lacombe, in the United States Circuit Court, has handed down a decision perpetually enjoining the Bryan-Marsh company from manufacturing any incandescent electric lamps made in accordance with or embodying any of the inventions claimed under letters patent issued on June 14, 1881, to Thomas A. Edison, and now the property of the Edison Electric Light company and Edison General Electric company.

There were filed at Albany and with the county clerk yesterday the largest application for railroad franchises ever made in Kings county. The applicants are the Brooklyn City Railroad company, its lessee, the Brooklyn Heights company, and the Brooklyn City & Newtown Railroad company. The application asks for 200 miles of Brooklyn streets for the building of street railroads. It will be formally presented to the Board of Aldermen on Monday. It includes the recent Flynn syndicate application and 140 miles of additional streets, reaching from the bay to the Queens county line. If the Heights people should get these extensions, they would double their mileage and become probably the largest surface railroad company in the world.

Charles F. Franklin, chief trolley inspector of Brooklyn, reports to Mayor Schieren that there were 105 trolley ordinance violations last month. The highest speed noted was on Nostrand avenue, and was at the rate of 25 miles an hour. "I would state," Mr. Franklin says, "that the running time on the various lines has been reduced, thus increasing the speed, and consequently the number of accidents, which now number two daily."

The National Electrical Exposition company has been incorporated for the purpose of holding an electrical exhibition here in May next in connection with the nineteenth convention of the National Electric Light association. The officers of this company are Harrison J. Smith, superintendent of the Edison Illuminating company of New York, president; Wm. F. Weiss, vice-president of the New York Steam company, vice-president; George F. Porter, secretary and treasurer. The executive committee, which is the governing power of the company, is composed of H. J. Smith, C. O. Baker, Jr., R. B. Corey, H. L. Lufkin and E. F. Peck. The board of directors consists of H. J. Smith, C. O. Baker, Jr., John A. Seely, R. B. Corey, W. A. Stadelman, H. H. Harrison, H. L. Lufkin, W. F. Weiss, J. W. Godfrey and E. F. Peck. The stock has all been subscribed and 10 per cent. of the capital paid into the hands of the treasurer. The New York Industrial building has been secured for the exhibition hall. This building occupies the block bounded by Forty-third and Forty-fourth streets, Lexington avenue and Depew place. The building was constructed expressly for trade exhibitions. It has seven stories with roof garden, is lighted by a plant of 5,000 incandescent lights capacity and has a spare steam plant of 300 horse power. The lighting companies of New York can also supply direct or alternating current to any amount desired, and two gas companies can furnish gas through two four-inch mains. The company is now prepared to receive applications for space. All communications should be addressed to the executive office of the company, 136 Liberty street, New York. W. F. O.

## Buffalo and Niagara Falls.

BUFFALO, December 7.—The Board of Aldermen has unanimously decided to grant a franchise to the new electric street railway company, of which Tom L. Johnson is the guiding spirit. If the councilmen do not agree with the Board of Aldermen, and alter the franchise, the document will go back to the Board of Aldermen in its amended form. It will then travel between the council and the Board of Aldermen until the two bodies agree. Then the franchise will be forwarded to the mayor for his approval. If he signs it the Buffalo Traction company will have secured the prize. The Common Council will consider the matter at a public hearing on December 21st at 10 A. M.

The Niagara Falls and Buffalo trolley line is being operated by Niagara Falls power to the city line of Buffalo, the power house at Tonawanda having been closed for a time.

Gen. John C. Graves, president of the Citizens' association, says in relation to the distribution of the power from Niagara Falls in Buffalo: "I feel sure that the settlement of this vexed question of a power franchise will have an immediate and all-round good effect. It will bring money to Buffalo, it will bring business here, it will bring manufacturers and thousands of other people here. The power will be much cheaper than the average, and this will be especially true to small consumers—those whose business requires say no more than 50 or 75 horse power. Its effect on the outside world and on business at home I think will be observed immediately." F. C. P.

## Northwestern Notations.

MINNEAPOLIS, December 7.—F. H. Osgood, A. L. Hawley and J. T. Robinson propose to put in an electric light plant for Seattle, Wash., and sell it to the city on the installment plan, in 36 monthly installments of $1,833 each, the plant to cost $66,000. They propose to bury their wires, and to avoid tearing up the streets will run their conduits in the alleys.

The Plainview, Minn., local paper suggests putting in an electric light plant in connection with the waterworks.

The city of Mankato, Minn., has made an agreement with the Mankato Gas & Electric company, by which that company will furnish light for an indefinite length of time at $2 per month per light for incandescent and $8 for arc, and the street lights have been turned on again.

The Edison Light & Power company will string 14 miles of wire on the north side of La Crosse, Wis., to furnish light for private parties.

New equipment is being placed in the electric light plant at Grand Rapids, Minn.

Electrician Sam Sullivan got lost in the loft of the Hotel Spaulding, Duluth, while examining the electric wires. His candle blew out, and having no matches he could not find the exit. For three hours he crawled about the loft, which is 50 by 100 feet, before he found the trap-door.

It is understood that work will soon be begun on the Oshkosh line of the Central Wisconsin Electric Railway company.

The National Electric company of Eau Claire, Wis., secured the contract for enlarging the Rochester, Minn., electric light plant.

The various telephone and telegraph companies at Winona, Minn., have been notified to paint their poles, a separate color being given each company to distinguish the poles.

Louis Wade of the Edison works at La Crosse, Wis., had three fingers split at the ends by coming in contact with a live wire.

The city council of Des Moines, Ia., is considering an underground wire ordinance.

It is announced that all contracts have been let for the construction of 15 miles of electric street railway in Oskosh, Wis., and 26 miles of suburban line to Kaukauna, for the Central Wisconsin Electric Railway company. The con-

struction contract aggregates $350,000, and the steam plants, cars and electrical apparatus $155,000 more. It is to be completed June 15, 1896.

General Manager H. R. Warren of the Duluth Street Railway company, was arrested and charged with violating the state law requiring all street cars to be vestibuled between November 1st and May 1st. During the trial it developed that the law is defective and that it does not provide any penalty in the event of the fine not being paid. The jury disagreed.

Business men of Trempealeau, Wis., will endeavor to secure an appropriation from the next legislature to have the Trempealeau river improved so as to be navigable for canal boats and smaller craft. With that secured they will then fit out a trolley electric system to operate the canal boats, and will furnish light and power to the cities along the river.

It is announced that the Twin City Rapid Transit company will build a second interurban electric line between Minneapolis and St. Paul, which will relieve the congested condition of the present line and will afford the people of St. Anthony Park the connection with Minneapolis which they have so long demanded. The line will be a continuation of the Como avenue line in Minneapolis, running via the county road to St. Anthony Park, past the state fair grounds, through Warrendale, to Como Park, and via Rice street into St. Paul. It is estimated that to relay that part of the line already built, grade the rest and construct it with 80-pound steel will cost $87,000. A bonus of $35 000 is asked, and those interested have offered $25,000. It is probable they will get together on the amount and it will be built. It is promised to be in operation by June 1st, if the proposition is accepted.

Walsh Bros. of Clinton, Ia., are applicants for a franchise at Davenport, Ia., for an electric light, gas and steam heating plant. They propose to form a company with $300,000 capital stock.

The city of Davenport, Ia., is taking bids until December 31st for a five-year contract to light the city.

Waubay, S. D., is to have an electric light plant.

A right of way is being secured for the La Crosse, Black River Falls & Neillsville Electric railway. The estimated cost of the line from La Crosse to Black River Falls is $300,000. of which $289,000 has been subscribed.

The Parkview Mining company of Crevasse, Mont., is considering putting in an electric light plant in the spring.

The electric light plant at Chariton, Ia., has broken down for the third time, owing to its boiler being worn out.

The Dubuque, Ia., city council committee on electricity recommends the appointment of a city electrician.

Malicious persons tore down several miles of wire of the Postal Telegraph company and the telephone exchange at Webster City, Ia. A reward of $100 was offered to apprehend the miscreants.

The Eastern Coal & Coke company of Belt, Mont., will put in an electric light plant this winter or in the spring.

The electric light company at Beatrice, Neb., will shut off the street lights unless the city will increase the amount paid materially. The council offered to pay the same amount for a midnight service that it has been paying for all-night service, but the company will not accept it.

The council of Oshkosh, Wis., has made an informal statement that the Central Wisconsin Electric Railway company must have seven miles of road laid by January 1st to secure an extension of the franchise.

M.

## PERSONAL.

Francis R. Upton, general manager of the lamp department of the General Electric company, has severed his connection with that company to accept a responsible position in the general manager's office of the National Tube Works of McKeesport, Pa. Mr. Upton is very well known to the electrical fraternity of the entire country, and only good wishes follow him in his new business association.

## ELECTRIC LIGHTING.

Webb City, Mo., is about to award an electric light franchise.

Redwood City, Cal., expects to soon have an incandescent electric light system to cost $30,000.

Unionville, Mo., has decided to erect an electric light plant. Bonds will probably be issued.

The city of Sauk Rapids, Minn., has voted to issue $25,000 worth of bonds to build an electric light plant.

## ELECTRIC RAILWAYS.

It is proposed to organize a company to build an electric railway from Mill Valley to North Amherst, Mass.

A mandamus suit to compel the mayor and the city collector of Chicago to enforce the ordinance of April 1, 1881, in relation to the license fee of street railway companies, was begun on December 4th in the Superior Court. It was filed by Jesse B. Barton, ex-assistant corporation counsel, and the petitioner is Frank J. Coates. The petitioner says the companies own and actually operate cars as follows: The South Chicago Street Railway, 91 cars; Calumet Electric, 106; North Chicago, 747; Chicago City Railway, 1,962; West Chicago Street Railroad, 2,184; North Chicago Electric, 44; Chicago and Jefferson Urban, 33. The court is asked to issue a mandamus writ to compel the city officers to enforce the ordinance as it stands and make the companies pay $5 for every car, which would result in a large increase in the revenues of the city. At present the companies pay according to the number of trips and not according to the number of cars. The case will be heard by Judge Ewing.

## POWER TRANSMISSION.

The incorporation of the Pacific Transmission company of San Francisco marks the beginning of an interesting project for the electrical transmission of power from the mouth of California coal mines. The company will be controlled by the San Francisco & San Joaquin Valley Coal company, whose mines are at Corral Hollow in Alameda county, and is one of several important undertakings connected with that corporation. The new company will have a capital of $3,000,000, divided into 30,000 shares of the par value of $100 each, and will be empowered to build and operate steam and electric plants at the coal mines in Corral Hollow and Alameda county for the purpose of generating electrical power, and furnishing the same by transmission over wires to Oakland by way of Livermore, Haywards, San Leandro and other towns en route, and also to San Jose and to Stockton. It is intended to ultimately extend the service to San Francisco. At least $1,000,000 will be expended in the construction of the plants, and it is said that the General Electric company, which put in the plant at the Folsom dam which furnishes electrical power to Sacramento, and has recently arranged to supply Fresno with similar power from a distance of 35 miles, will have the contracts. The cheapest item connected with the generation of the electrical power will be the fuel, which will consist of the waste and refuse screenings, dust, etc., from the coal produced at the extensive Corral Hollow mines. The supply of this kind of fuel will be almost inexhaustible, and as it is extracted from the mines with the merchantable coal it is all paid for by the latter. As the coal company will control the transmission company there will be no charge for this fuel. The plant at the mines will generate at the start 6,400 horse power, of which about 5,000 horse power will be supplied to San Jose and to Oakland, through the towns en route, and afterward Stockton will be taken in, and if necessary the supply can be increased so as to extend the service even to San Francisco and other more distant points. The company expects to furnish this power to Oakland, San Jose, Stockton and intervening places at $60 per horse power per year. The present cost ranges from $60 to $80, according to conditions.

## MISCELLANEOUS.

A unique electric elevator has recently been built for the Ottawa Canoe Club, Ottawa, Ont. Owing to the great rise of the Ottawa river every spring, the boat house is situated a good height above the water level the greater part of the year. The transfer of the boats from the house to the water, and *vice versa*, was thus extremely difficult, and to obviate these drawbacks there has been erected a framed gangway, with a skeleton car, an ordinary worm-geared hoisting drum, and a three kilowatt 500 volt Edison motor. The motor is belted to a countershaft, which, in turn, is belted to the shaft carrying the worm. The car stops automatically at the top and bottom of the allotted course. Mr. Dion, of the Ottawa Electric company, treasurer of the club, designed the arrangement.

## TRADE NEWS.

The Philadelphia Electrical Equipment company of 816-822 Cherry street, Philadelphia. has been incorporated to do a general line of business in electrical repairing. All work is guaranteed, and the company is prepared to handle all the business that is offered.

The Indiana Rubber & Insulated Wire company, manufacturer of the widely known Paranite wires and cables, announces that it has removed its office from Marion, Ind., to its factory at Jonesboro, Ind. It is believed that the handling of the business will be materially facilitated by this change.

About two years ago the Jewell Belting company of Hartford, Conn., purchased the rights for the manufacture of a cement to be applied to the face of pulleys, to prevent the slipping of belts, especially those used for high speed, and after over a year's trial by a number of the leading electric light and power stations the Jewell people are receiving high endorsements of the success of this cement, accompanied by large orders.

The Eddy Electric Manufacturing company of Windsor, Conn., is endeavoring to keep abreast with the large number of orders which have been placed with this concern, and Secretary Newton reports that it will be necessary to run many departments of the factory over-time in order to fill orders promptly. The apparatus manufactured by the Eddy Electric Manufacturing company is widely known as being standard, and it is gratifying to note the continued success of the company.

The Upton arc lamp for alternating current (made noiseless by means of the new anti-hum device which is applied only to the Upton lamp) is one of the most popular specialties in the long list of the Electric Appliance company, which states that every sample lamp sent out means an additional regular customer of the Upton lamp. The cost of this anti-hum device is comparatively small; its use is said to mark the difference between a satisfactory and an unsatisfactory alternating arc lamp for inside use.

F. M. Bernardin, Kansas City, Mo., dealer in general electric railway supplies, has met with encouraging success in dealing with western buyers. He is agent for a large number of excellent specialties and can furnish anything used in the construction and maintenance of an electric railway. Mr. Bernardin is agent for the Ohio Brass company's supplies and has done a large business in this line in particular. He is able to supply the H. & C. sleet cutting trolley wheel for which many strong claims are made. Mr. Bernardin is an energetic business man and his long experience with electric railways enables him to meet and overcome any difficulty which may arise with dispatch.

Some idea of the diversity of uses to which electric motors are now being put, and the rapid spread of electricity in different directions, may be gathered by glancing at the list of orders for motors received in the power and mining department of the General Electric company during one month last summer: Operating mining machinery, shoe factory, operating a yarn factory, a tannery, a powder mill, a watch factory, iron working machinery, a foundry, hoists for electric cranes, ventilator on a gunboat, propelling electric launches, the operation of elevators, blowing church organs, operating woolen mills. These orders are scattered throughout the following named states and nations: California, Colorado, Indiana, Ohio, Connecticut, Michigan, Pennsylvania, Rhode Island, Wisconsin and New York, Peru and Brazil.

Western Manager C. W. Woodward, of the Chicago office of the Electric Storage Battery company of Philadelphia, has received an order from the Chicago Telephone company to furnish a 43 kilowatt battery for its exchange at Oakland and a four kilowatt battery for its exchange at Pullman. These cells will be used as a central station equipment for the two branch exchanges located at the places mentioned —a service for which the chloride accumulator has been adopted by the Chicago Telephone company. This is only one of the numerous orders received for chloride accumulators for telephone work, showing a growing tendency on the part of telephone companies to utilize storage batteries for their exchanges to the exclusion of other forms of apparatus. Mr. Woodward is much pleased over the increase in western business and states that the orders have been coming in at a rapid rate of late.

The Raymond improved gas engine, built by the J. I. Case Threshing Machine company of Racine, Wis., has attracted wide attention in the West by reason of its great economy, steadiness of operation, fine workmanship and compact, vertical arrangement. It is especially adapted for electric lighting plants, and although but recently placed on the market has met with such success that even the great facilities of the Case company have been taxed to meet the demand. The engines are built in sizes from one to 300 horse power, and with single, double or quadruple cylinders. They are illustrated and described in a fine catalogue which has just been issued by the company, and which will be sent on application. The company claims the greatest economy of gas or gasoline in proportion to power developed, and cites this instance: "One of our 50 horse power (actual) double cylinder engines belted direct to a 50 horse power T. & H. arc dynamo, and producing 52 arc lights over 28 miles of wire, performed the work by actual official test as follows: Figuring one arc light per horse power, 52 horse power was developed on five gallons of 74° gasoline for one hour and 47 minutes, or one-eighteenth of a gallon per horse power per hour."

## BUSINESS.

The Peru, Ind., Electric Manufacturing company's business is increasing rapidly. The factory is now running until half past nine o'clock at night to enable it to keep up with orders.

A. O Schoonmaker, 158 William street, New York, imports India mica, and can furnish this product in any size, shape or pattern, cut for commutator segments, washers, etc., or in any other form desired.

The electrical department of the Chicago General Fixture company, in charge of F. Overbagh, has been extended to occupy the entire third floor of the building at 169 Adams street, as well as the fourth floor, which formerly sufficed.

Dixon's silica graphite paint, manufactured by the Joseph Dixon Crucible company of Jersey City, N. J., will be used in painting all the tin work and skylights of the Post-office Department building at Washington. A quantity will also be used on the capitol and the District government building.

The Clonbrock Steam Boiler company of Brooklyn builds Morrin Climax boilers ranging in capacity from 50 to 1,000 horse power. The company desires to make this clear, as in an advertisement recently printed in the WESTERN ELECTRICIAN a typographical error made it appear that 100 horse power was the maximum.

Charles A. Bramhall, general sales agent in charge of the New York office of the Standard Thermometer company, which manufactures the well-known Upton arc lamp, reports that the factory is rushed with orders and that in his local territory he is more than satisfied with the future outlook for the success of his company's interests. Mr. Bramhall is one of the pioneers in the arc lamp business, a pushing salesman, and has a host of friends who will wish him continued success.

McLeod, Ward & Co. of 27 Thames street, New York, are having a boom in their Kinsman desk light. Orders have come in so rapidly upon them of late that it has taxed their capacity to fill them promptly. The many features of excellence in the Kinsman desk light are noted when it is understood that it serves as a reflector, may be moved to any desired angle, produces a soft light because of two glass cylinders, one of clear glass and the other of ground glass, which can be turned by a knob at the further end. It is always within easy reach of a person sitting

at the desk. These fixtures are fitted with any style of socket and are made in two styles, the only difference being in the style of the stand ornamentation. They have been designed for use on flat desks and tables, and are made handsomely, being nickel-plated throughout.

J. W. Mason, Kansas City, Mo., who carries one of the most complete stocks of electrical supplies west of Chicago, reports an excellent business. Mr. Mason is the Kansas City agent for the New York Insulated Wire company's brands of wires, and has secured many orders for "White Core" and "Raven Core" wires. He is in a position to furnish almost any electrical specialty on the market and makes it a point to give all orders prompt attention. The prospects for the continuation of the present good business in Mr. Mason's territory are very encouraging.

A California excursion of business and professional men will leave Chicago and St. Paul Thursday, January 2d, and February 6, 1896, in Pullman tourist sleeping cars, over the Chicago, Milwaukee & St. Paul, the Union Pacific and the Southern Pacific railways, via Omaha and Ogden, for Sacramento, San Francisco, San Jose, Monterey, Los Angeles and the fruit districts of California. The tourist sleeper rate—double berth (room for two persons)—from Chicago or St. Paul to San Francisco is $6. Sleeping-car berths should be engaged at once. Send orders for berth, with cash, to F. H. Thorn, city ticket agent, C., M. & St. P. Ry., 365 Robert street, St. Paul, Minn., or C. M. Souther, city ticket agent of C., M. & St. P. Ry., 95 Adams street, Chicago, Ill. For particulars and circulars apply to nearest ticket agent, or address S. Sherin, excursion manager, Palmer House, Chicago, Ill.

It is pleasure to give credit where credit is due, and certainly Western Manager J. R. Wiley and Superintendent of Construction F. S. Vieley are to be congratulated on the Standard Underground Cable company's installation of its cables in the new quarters of the Postal Telegraph-cable company at Chicago. The elaborate article in another column presents many important features of the Postal company's present plant, and from the fact that Standard underground cable plays such an important part in the equipment, carrying, as these cables do, the main lines of the Postal company, it is not to be wondered that the western department of the Standard Underground Cable company feels that its work in the Postal quarters will stand for many years as a monument of a most successful cable equipment. The tests of these conductors show a remarkable insulation that speaks well alike for the cables themselves and the high-class construction work.

In a recent booklet telling "Something About Westinghouse Engines," the Westinghouse Machine company gives interesting details of its methods of testing. It appears that "Every engine, from the five horse power junior to the 700 horse power compound, after being assembled, is taken to the testing room and run continuously for several days under full load and with every condition of actual service. From there it is removed to the overhauling floor and taken entirely to pieces. An examination of the piston and valve rings is then made to ascertain if they bear properly all around; the journals and wearing surfaces are inspected to make sure there is no tendency to heat or cut; and a final and exhaustive search is made for defects of any nature. When everything is known to be right the parts are reassembled, all adjustments made permanent, and the engine is then ready for jacketing, painting and shipment." The company says that its engine is most bitterly attacked on the score of wastefulness of steam, and in order to satisfy buyers it makes this liberal proposition: "The unequaled facilities of our testing shop are at the disposal of any purchaser who may wish to satisfy himself on this point, before placing his order. Not only this, but he is cordially invited to bring his own expert to conduct such test, and may rely on our assistance and co-operation to make it thorough and conclusive. If other engines are offered on the same basis, it is then simply a matter of comparing results—where we are entirely willing to let it stand."

# ILLUSTRATED ELECTRICAL PATENT RECORD.

*Issued December 3, 1895.*

550,574. Electric Arc Lamp. Thomas E. Adams, Cleveland, O. Application filed March 14, 1895.

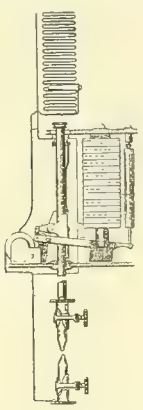
A clutch comprising a saddle is adapted to bear against the carbon rod, and having ears projecting beyond the same, a bifurcated lever is pivoted between the ears, and a shoe is pivoted in the lever and adapted to bear against the carbon rod.

550,577. Electric Switch. Christoph Bach, Jr., Milwaukee, Wis. Application filed April 12, 1895.

One claim is given: In a knife switch, a two-part handle, one part being rigidly connected to the switch blades, and the other part being pivoted to the rigid part, and a retracting spring connecting the two parts.

550,600. Electric Arc Lamp. Stefan Doubrava and Josef Donát, Brünn, Austria-Hungary. Application filed February 2, 1895.

An arc light comprising the combination of carbon holders, a regulating solenoid, a core for the same and side rods for the core, the solenoid being considerably shorter than the core and sliding thereon between its ends, and the carbon holders being directly attached to one of the two elements of the magnetic system.



NO. 530,574.

550,638. Electrical Protective Appliance. Alfred H. McCulloch, Boston, Mass. Application filed September 14, 1895.

A protective fuse is employed, comprising a section of easily fusible conductor smaller at its middle than at its ends, combined with a non-conducting, incombustible sheath applied thereto and surrounding the same, the sheath being loose and porous for the ready escape of gases.

550,663. Dynamo-electric Machine for Plating. William M. Thomas, Chicago, Ill. Application filed March 25, 1893.

The arrangement is such that current may be furnished for two or three circuits of different constant voltage, a field shunt and series coils being arranged in the divided circuits and compounded with the shunt.

550,666. Dynamo-electric Machine. Henry P. White, Kalamazoo, Mich. Application filed January 29, 1895.

The combination includes a suitable shaft, a plurality of armature heads on the shaft with the magnets alternating to act successively and alternately in appropriate fields, a suitable commutator connected to the armatures to receive impulses from the armature heads successively and alternately to utilize a large number of magnets in a revolution of the shaft with a comparatively small diameter of armature heads to increase the power of the machine without increasing its rate of motion.

550,670. Signal Circuit. John V. Young, Boston, Mass. Application filed July 8, 1893.

There is an insulated rail section in one line of rails, a battery, a shunt or "cut-out" circuit including therein the insulated section of one of the lines of rail and one of the rail sections of the other line of rails, and a "relay" circuit controlling a signal or indicator, and including therein the insulated section and the other rail section, the insulated sections in the same line of rails being in such proximity to each other that the circuits including them can be simultaneously closed by the same car or train.

550,682. Voltmeter. Frank Holden, Schenectady, N. Y. Application filed August 31, 1895.

In an electric measuring instrument, the combination of field coils, an indicating coil mounted upon a shaft and provided with an index, hubs also mounted upon the shaft and connected to the terminals of the indicating coil, and zigzag flat springs secured at one end to the hubs and at the other to circuit terminals.

550,683. Trolley Wire Crossing. John C. Kinney, San Antonio, Tex. Application filed April 17, 1895.

The separate triangular-shaped brackets or arms are bolted to an insulating block or core, with a round-ended cone at bottom part of the same size as the trolley wire, and having two independent bolt holes for bolting the brackets or arms in pairs, insulated from each other to the insulating block or core, thus giving a continuous current without interferring with the cross line.

550,686. Electric Cigar Lighter. James F. McLaughlin, Philadelphia, Pa. Application filed April 24, 1893.

A heating conductor is disposed between layers of asbestos with a superposed sheet of wire gauze, and suitable circuit connections.

550,688. Electro-therapeutic Apparatus. Charles Palmleaf, Seattle, Wash. Application filed April 1, 1895.

An induction coil having a hollow or tubular core, an auxiliary core provided with a series of spirally arranged perforations.

550,692. Armature. Henry G. Reist, Schenectady, N. Y. Application filed August 31, 1895.

In the armature shown the core has notches of two different sizes, a series of main coils in the larger notches, and a second series of smaller or "teaser" coils in the smaller notches, one end of the series being connected to the middle of the series of main coils.

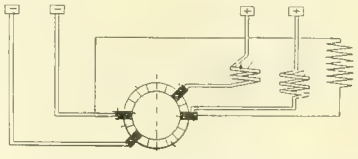
550,703. Commutator. Henry P. White, Kalamazoo, Mich. Application filed January 29, 1895.

One claim follows: In a commutator, the combination of conductor members in pairs, each pair of which is independently connected, and each member of which is insulated from the other, a member of each pair permanently connected in opposite ends of an electric circuit, an equal number of commutator sections to each member connected with said members alternately and successively; brushes for traversing the commutator sections to commutate a current either to or from the electric circuits.

550,728. Automatic Telephone Exchange System. James G. Smith, New York, N. Y. Application filed February 18, 1893.

The last claim says: In a telephone system, the combination with a central office switching apparatus for connecting subscribers' circuits, and a subscriber's circuit including a number of subscribers' stations, of an electro-magnetically controlled shunt switch at each station, a normally closed shunt controlling circuit including all of the shunt switches, whereby the subscriber's circuit is normally maintained through the instruments at all the stations, a local shunt controlling circuit at each station with contacts therein moved by the shunt switch to break the local circuit when the switch is released by the main shunt controlling circuit, and a switch at each station for breaking the main and establishing the local shunt controlling circuit, whereby all the shunt switches save that one will be operated to shunt the instruments at their stations respectively.

550,729. Automatic Exchange System. James G. Smith, New York, N. Y. Application filed February 20, 1893.



NO. 550,663.

In an automatic exchange system for telephonic and telegraphic purposes there is the combination with a plurality of main or trunk lines, and independent automatic switches at each end of the trunk lines independently controlled from the subscriber's station, of a loop circuit connecting the switches at each end and a local subscriber's station, and circuit connections between the same and the switches for controlling the latter, whereby a complete metallic circuit may be automatically formed between the distant stations.

550,733. Electric Safety Device. Elihu Thomson, Lynn, Mass. Application filed May 19, 1887.

The combination is claimed with electric main supplying devices in multiple, of a lightning arrester for both poles of the circuit, an arc-rupturing magnet or magnets for rupturing an arc following a discharge over either pole, and means for rupturing a cross or short-circuit from one main to the other through the lightning arrester resulting from a discharge to ground from both mains together.

550,765. Signaling Apparatus for Telephone Switchboards. Charles E. Scribner, Chicago, Ill. Application filed April 16, 1895.

A source of current and a signaling instrument are adapted to be displayed when excited by a predetermined current, a shunt about the signaling instrument forming with a portion of the signaling circuit a closed local circuit through the signaling instrument including a source of current, the current in the local circuit being almost sufficient to display the signal.

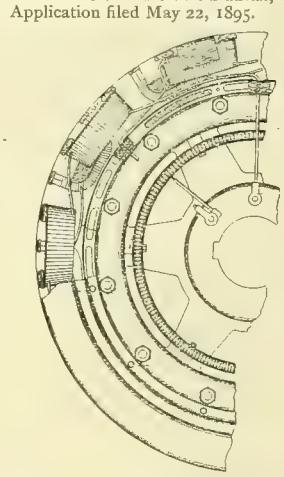
550,782. Method of Distributing Electricity to Electric Lighting Systems. Charles M. Davis, Chicago, Ill. Application filed April 14, 1892.

A source of electrical energy of continuous direction; sets of converters and alternators are employed, the several sets being arranged at different phases and in multiple one with the other.

550,822. Self-winding Electric Clock. Charles M. Crook, Chicago, Ill. Application filed March 25, 1895.

In an electric winding device, in combination with the electro-magnet, its energizing circuit and its armature a lever which carries the armature, the main spring, a spiral sheave suitably connected to the main spring to wind it up when properly rotated, a flexible strap, chain or cable connected to the armature lever and running thence about the spiral sheave and secured thereto.

550,823. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed May 22, 1895.



NO. 550,692.

The combination in an electric meter of a retarding mechanism consisting of an aluminum disk traversing the field or fields produced by one or more permanent magnets having their like poles upon the same side of the disk, and a magnetic shield.

550,841. Electrical Measuring Instrument. Herschel C. Parker, Brooklyn, N. Y. Application filed May 9, 1895.

There is the combination with a base, of a magnet supported thereon, a frame embracing the poles of the magnet, a coil arranged between the poles, a spindle at the upper and lower portion of the coil, and having bearings in the frame, an arm extending upwardly from the base and thence to the center of the coil, a sleeve carried by the extremity of the arm, two springs connected to the arm and to the upper and lower parts of the coil respectively and arranged within the sleeve, an indicator carried by the coil, a scale and electrical connections

550,857. Electric Time Alarm Attachment. Max Wolff, New York, N. Y. Application filed July 3, 1895.

The combination includes an alarm post of a clock or like mechanism, an electric circuit including a generator, and an alarm, a back board separating the two and provided with an extension at one end adjacent to the terminals of the circuit and located between the same, the terminals of the circuit being flexible and connected at their free ends by a block of insulating material, a flexible loop of insulating material connected with the insulating block, and a clip carried by the loop and adapted for engagement with the alarm post, whereby when the alarm post turns the flexible loop will be twisted and the terminals of the circuit will be crossed one over the other and brought in contact with each other, closing the circuit.

550,860. Electric Car Lighting Apparatus. William Biddle, Brooklyn, N. Y. Application filed January 7, 1895.

The combination includes a dynamo, having field helices and cores and neutralizing helices, and their pole pieces within the cores of the field helices, a secondary battery, an electro-magnetic pole changer, and circuit connections for directing the current according to the direction of rotation of the armature, and for energizing the neutralizing magnets in proportion to the speed.

550,866. Electric Furnace. Frederic Chaplet, Laval, France. Application filed May 29, 1894.

Features claimed are: The heating chamber, the hollow retort extending into the same to contain the material to be heated, and the carbon pencils arranged to form an arc adjacent to the retort, the retort having its inlet end outside the walls of the furnace and closed by a suitable stopper.

# Western Electrician.

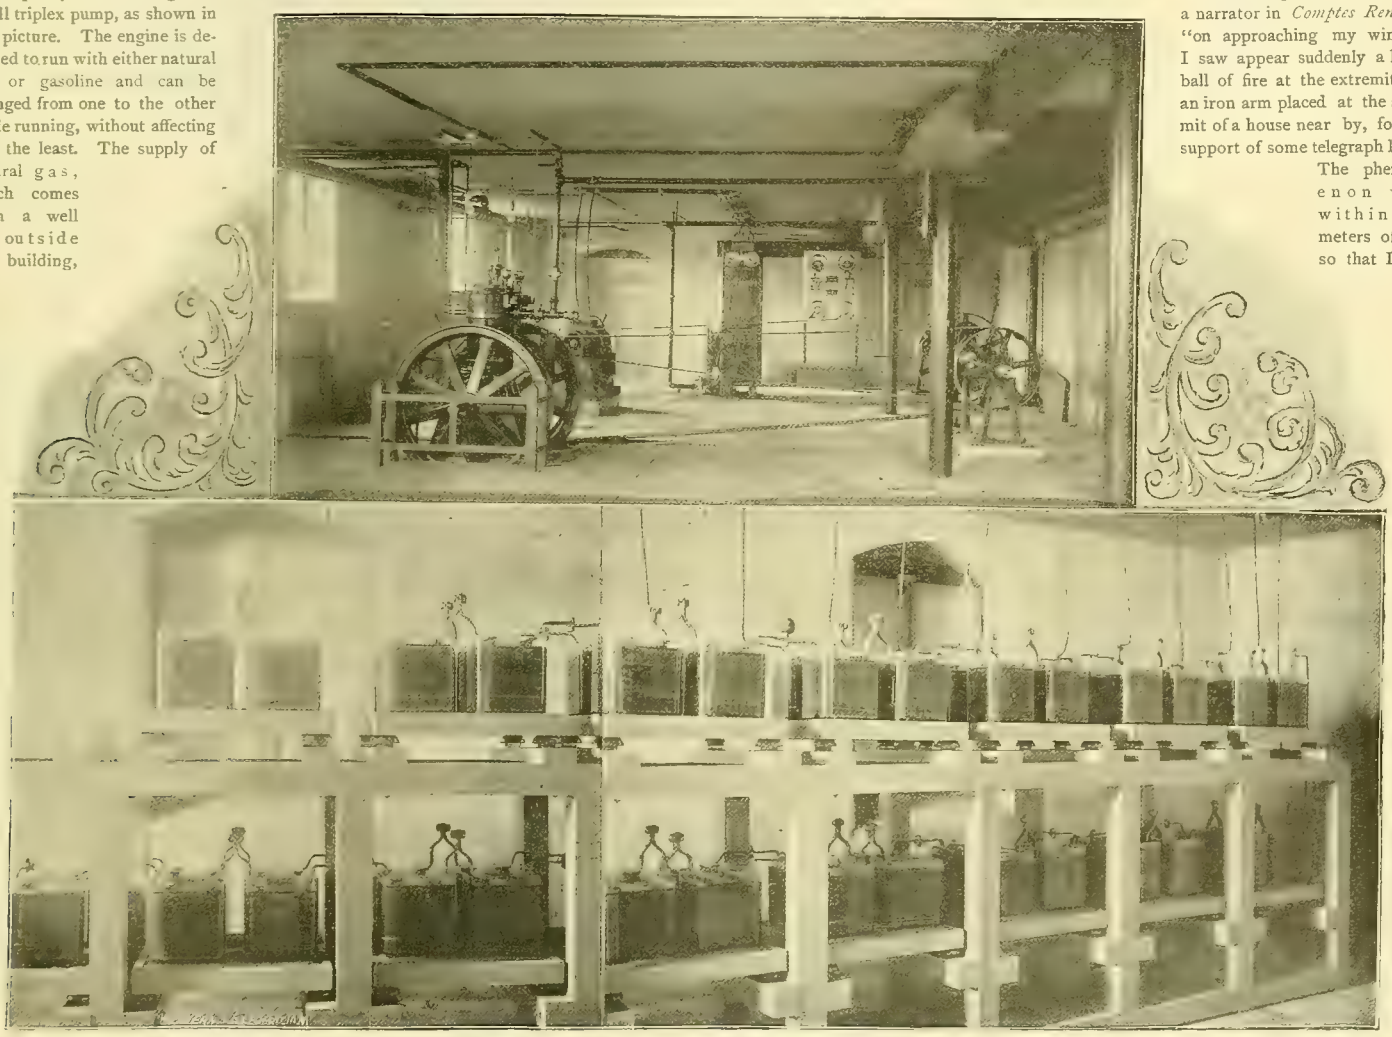
EVERY SATURDAY.

Vol. XVII CHICAGO, DECEMBER 21, 1895. No. 25

## Electric Light Plant Installed for the Franciscan Fathers at Oldenburg, Ind.

This small but interesting plant was designed to furnish light and power for the buildings of the Franciscan Fathers at Oldenburg, Ind., and consists of a 25 horse power Raymond gasoline engine built by the Wallace & Graves Manufacturing company of La Fayette, Ind., a 12 kilowatt bipolar Siemens & Halske dynamo and a 250 ampere-hour battery of chloride accumulators.

The gas engine is belted directly to a jack-shaft, upon which is mounted a friction clutch for the dynamo and a loose pulley for driving the small triplex pump, as shown in the picture. The engine is designed to run with either natural gas or gasoline and can be changed from one to the other while running, without affecting it in the least. The supply of natural gas, which comes from a well just outside the building, is, however, somewhat unreliable, so that provision is made to use gasoline when the supply fails.



ELECTRIC LIGHT PLANT INSTALLED FOR THE FRANCISCAN FATHERS AT OLDENBURG, IND.

The dynamo is the standard type of the Siemens & Halske company, being in this case wound for 150 volts, for charging the entire battery without the assistance of a booster. The field rheostat of this machine contains sufficient resistance to allow of running the machine direct on the lights at 110 volts, if desired.

The batteries are erected on a substantial wooden rack, as shown, and set in sawdust-filled wooden trays, these trays being set up on oil insulators. The battery is contained in a separate room, well adapted for the purpose, and is a model of convenience for examination and handling.

The switchboards, shown in the rear of the room, are separately designed for the battery and the dynamo. The atter is at the left of the picture and has two Weston instruments, six circuit switches, a main dynamo switch and a field rheostat, mounted upon black slate, while the battery board contains two Weston instruments, two automatic switches for overload and underload, two knife switches and two end-cell switches. The battery switchboard was built by the Cutler-Hammer Manufacturing company of Chicago, while the cell equipment was installed by F. L. Merrill of the same city.

The order of Saint Francis, as established in the town of Oldenburg, comprises separate buildings for both the Franciscan Fathers and the Sisters of Saint Francis. In the sisters' buildings there is installed a 400 light multipolar generator of the Siemens & Halske type and a 300 ampere-hour storage battery. This plant was installed previous to the one of the Franciscan Fathers and has given satisfaction. The current from the batteries in both cases is used at any hour of the day for pumping the organs of the respective chapels.

The gas engine shown in the picture is also designed to drive the pump, which fills a number of large tanks on the upper floor of the buildings, these in turn supplying the entire water demand of the plant.

## Chicago Electrical Association.

The Chicago Electrical association, composed of young men interested in or connected with electrical pursuits, is now holding semi-monthly meetings at 1737 Monadnock block on Friday evenings at 8 P. M. Papers are announced as follows: December 20th, "What Next in Electric Railway Work?" J. R. Cravath; January 3d, "The Protection of an Invention," W. Clyde Jones; January 17th, "Armature Windings for Multipolar Generators," F. A. Muschenheim;" February 6th, "Lightning Arresters," W. R. Garton; February 20th, "The Outlook for Electro-chemistry," Bertrand S. Summers.

## A Striking Electrical Phenomenon.

After a dry season of several months rain fell at Grenoble, France, on the 2d of October in the afternoon. The rain-storm was without the accompaniment of either thunder or lightning, although the skies were dark and gloomy, and the storm continued into the evening.

"About eight o'clock," says a narrator in *Comptes Rendus*, "on approaching my window I saw appear suddenly a large ball of fire at the extremity of an iron arm placed at the summit of a house near by, for the support of some telegraph lines. The phenomenon was within 100 meters of me, so that I had a very complete view. The ball, perfectly formed, despite the luminous radiations, was about 0.3 meter in diameter. It had the appearance of a powerful electric light. From the top of the arm support there was a constant gerbe of large sparks, like those from incandescent iron when struck with a heavy hammer. The little sparkling fountain was directed upward.

"After a time—40 or 50 seconds, I think—the ball suddenly divided into three smaller globes, the largest about the size of a toy balloon. The sparking ceased at once, and the three balls, all like the first as to appearance, rolled down the roof as if acted upon by gravity. Arriving at the gutter—possibly touching it, for there were sparks just then—the three balls simply went out, without noise or commotion. Almost immediately after a second ball appeared at the extremity of the arm. This did not remain long, but at the end of two or three seconds it vanished noiselessly. At the same instant from the extremity of the arm there was

a fountain of sparks precisely similar to the first as to size and color, and flowing in the same direction.

"I may add that about 5.30 P. M. a person worthy of credence saw at an interval of a few minutes two balls of fire at the same place, and related the same to me immediately afterward.

"I found the next morning that the arm, which had been vertical, was now inclined very perceptibly from the perpendicular.

"Several of the neighbors have related analagous experiences in other parts of the city."

## A Magnetized Watch in Early Days.

By Ralph W. Pope.

Those who are familiar with the life of the late Franklin Leonard Pope will remember that in his schoolboy days he was brought into close contact with railroad men, and became quite proficient in all the details of the locomotive and the track. His interest in railroad matters never lagged, and had he not been selected by Superintendent Lovett to learn to operate the Hughes printing instrument at Great Barrington in 1858 it is quite possible he would have become a civil rather than an electrical engineer. It was during his career as operator at this country office that he experienced a difficulty with his watch, of which the writer was reminded upon reading a recent article by Clark C. Haskins in the Western Electrician. The nature of his duties at Great Barrington made it necessary that he should carry a watch. Such a privilege was rare in those days, and the best watch within the reach of a person in moderate circumstances was an "English lever." It was a watch of this type, previously owned by his father, that was entrusted to the young man. It was not long before this watch, which had hitherto enjoyed a spotless reputation, began to exhibit certain eccentricities which made it necessary to have it overhauled and examined by the village jeweler. No improvement in its action was perceptible, and the watch was returned and re-examined time after time, but without effect. After despairing of a cure, some of the railroad men were conferred with, and it appeared that although Bridgeport was the end of their run, they did not entrust their timepieces to a city watchmaker. If there was any man in the country who could fix that watch, they informed its owner, "Thode" Heath of Curtisville was the person. It seemed strange that in a little hamlet, three miles from the nearest railroad station, should be found the only watch expert who was considered equal to any difficulty that might be encountered in his line. At the first opportunity the demoralized watch was entrusted to Mr. Heath, and in due time the owner was sent for. Upon reaching Mr. Heath's "laboratory" the watch was produced, and the expert said: "Young man, what kind of work are you engaged in?"

"I am the telegraph operator at Great Barrington," he replied.

"That accounts for it then. The trouble with that watch is that it has a steel balance wheel, which has become magnetized. Possibly it can be cured by substituting a gold balance wheel."

This diagnosis was no doubt correct, although made in 1858 by a country watchmaker, and probably before he had ever heard of such a thing as a magnetized watch.

It may appear strange that a watch should have thus been affected, considering the comparatively weak currents ordinarily used in telegraphy, especially on this line, which was only 25 miles in length, and energized by a Smee battery of 20 cells at each end. Those who are familiar with the construction of the old Hughes printer, however, will remember that on the right-hand side of the instrument was a large horseshoe permanent magnet, standing with the poles uppermost, and supported in an upright position by being fastened at the bend to the base of the machine. The operator, standing at his work (especially if he stooped, as was usually the case in manipulating the keyboard), was frequently close to this magnet, so that it was quite probable that the watch in the upper vest pocket was occasionally under its influence. Whether this was actually the case or not, the watchmaker fitted the watch with the gold balance wheel, and, so far as the writer knows, there was no further cause for complaint.

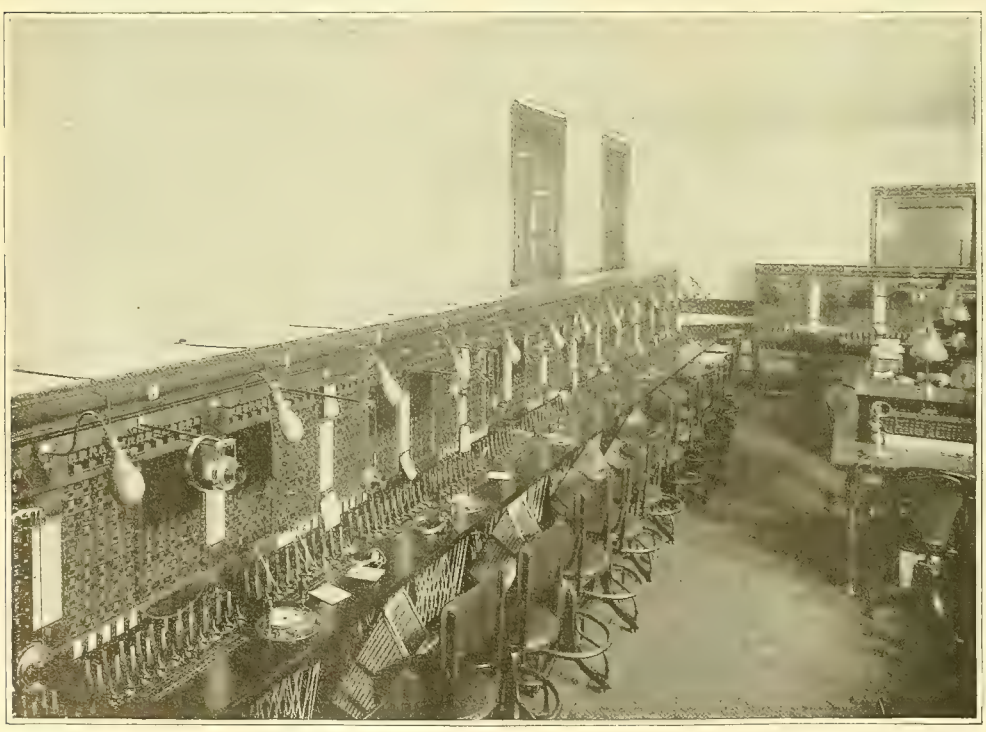


FIG. 1. THE CALCULAGRAPH IN TELEPHONE SERVICE.—VIEW OF "LONG-DISTANCE" SWITCHBOARD EQUIPPED WITH THE INSTRUMENTS IN NEW YORK.

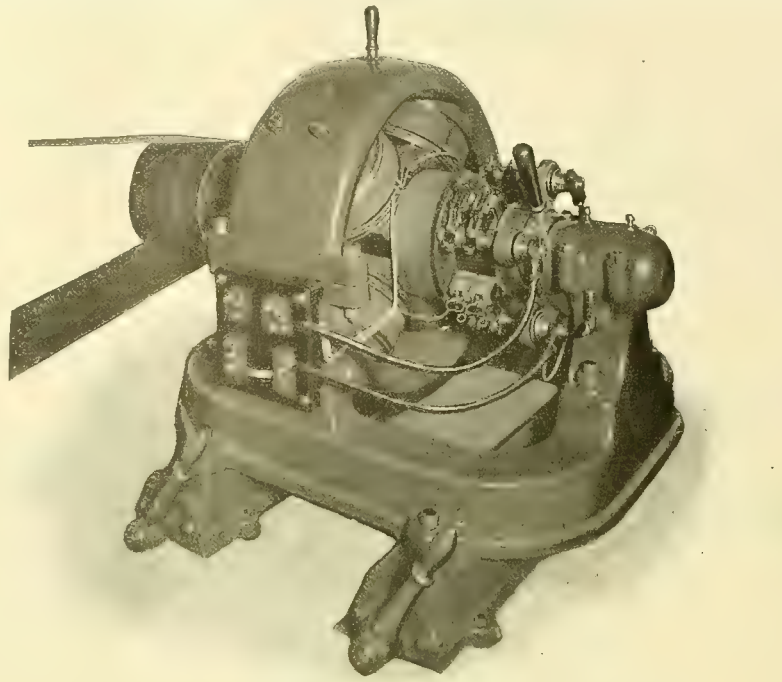
## Gates Multipolar Dynamo.

The new Gates dynamo, illustrated herewith, is the result of the experience of its designers in the erection and construction of a large number of dynamos during the last 15 years, particularly with direct-connected machines. In attaching dynamos to engines in crowded basements of large office buildings, and in other confined spaces, difficulties were encountered which were borne in mind in the design of this new machine. It will be noticed from the cut that either of the lower field blocks can be removed from the magnet ring for inspection without removing the armature or outer bearing. The belted machine differs from the direct-connected only in that it has a sub-base and sliding rails and in the speed. Both pedestals in the belted machine are removable, so that the armature can be taken out through the side, or by removing the upper yoke through the top. The idea of the Gates company was to simplify the machine in its construction as well as in the erection and handling afterward. That this has been accomplished is shown by the fact that from one pattern 18 different machines are built.



GATES MULTIPOLAR DYNAMO.

Open hearth steel pole-pieces are used, bolted to a cast-iron yoke. The armature is of a slotted ventilated type, with flexible bar winding. The commutator has removable segments, and on this feature great stress is laid. The company claims that it has overcome armature reaction by large field pieces with shoes and a heavy field charge. The armature and commutator are mounted on a sleeve through which the shaft for either the direct-connected or belted type is afterward placed. The illustration shows a belted machine of 25 kilowatts, designed to be operated at 850 revolutions.

These dynamos and a corresponding line of multipolar motors are built by the Gates Electric Manufacturing company, 1139 Monadnock building, Chicago, which has received flattering letters of commendation in relation to machines already installed.

## American Street Railway Association.

At a meeting of the executive committee of the American Street Railway association, held in St. Louis on December 9th, the Southern Hotel was selected as the headquarters for next year's convention in the city named. The meetings of the association will be held in the Olympic Theater, across the street from the hotel. The hall for exhibits has not been selected yet. The local committee is already hard at work, and is planning to make the convention of 1896 a memorable one. Secretary Penington suggests that prospective visitors make early reservation of hotel accommodations, as a large attendance is expected. Interesting topics of discussion have been selected, but the complete list of papers and authors will not be ready for some time.

Prof. Bigelow of Washington suggests the idea that the earth acts as the armature of a great dynamo, and by revolving in the sun's magnetic field generates the so-called earth currents of electricity. Mr. Lang thinks that by wrapping the earth with a suitable system of conductors, power could be obtained, and he even goes into a calculation how much it would be. The cost of such a plant would be, of course, enormous.

## The Calculagraph in Telephone Service.

In the early days of telephony exploiters found considerable difficulty in securing recognition for their scheme as a commercial possibility. The public was inclined to regard it as a scientific toy or a luxury in which only a chosen few could indulge. Under these conditions it is not to be wondered that the telephone companies' principal efforts were directed toward getting the people to use the telephone, and one of the inducements held out to subscribers at the time was that they could use the lines as long and as often as they saw fit. Now, however, the conditions have changed, especially in large communities and on the lines of the Long-distance company, and one of the great problems confronting the telephone companies is how to restrict the use of the telephone within reasonable bounds, so that important lines will not be constantly used by persons who could transact their business in much less time and with equally satisfactory results if they were compelled to do so.

Naturally, the first solution that suggests itself is the toll system, and this has been attempted, but the successful adoption of this plan involves many serious problems, and one of the first that confronted exchange managers was the question of seeuring a reliable system of recording the time occupied by subscribers in conversation. It was found by actual experience that where the company depended upon the operators to make a note with pen or pencil, on tickets or blanks prepared for the purpose, little reliance could be placed in the records. The arrangement was unsatisfac-

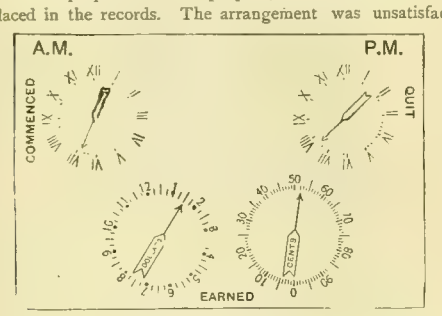


FIG. 5. THE CALCULAGRAPH IN TELEPHONE SERVICE.—RECORD OF EARNINGS.

tory to the company as well as to the subscribers, and was a source of many disputes. An idea of the trouble that was encountered can be gained from the experience of one eastern exchange, where a determined effort was made to devise a scheme by which the time occupied in conversation would be an important factor in the cost of the service. When the new rule was introduced the chief operator discovered that during busy parts of the day operators were in the habit of making half-a-dozen connections before recording any of them. An inspection of the cards showed in some cases that one operator would make six to 10 connections at exactly the same time—according to the records in the company's office—upon which it was necessary to compute the bills of subscribers. This, of course, was an impossibility, but it seemed equally impossible to correct the practice. In one case this was explained by the fact that the clock in the operating room was located in an inconvenient position and most of the young ladies were obliged to turn about and look at the clock each time they received a call, if they were to comply with the requirements of the company. Taking advantage of this experience, another exchange, also in an eastern city, purchased a large number of stop watches for its operators, but this only partially overcame the difficulty. The main objection to the scheme was the absence of some accurate and reliable method of recording the actual time of conversation so that it could be demonstrated beyond question not only that the service was given but that it was furnished at a certain time. To those who have had experience in long-distance service or in exchanges centrally located, from which many lines extend out to neighboring towns and villages, and where the business interests and social life of these numerous communities are so interwoven as to be practically a unit, the importance of this problem will be at once apparent.

About two years ago it was proposed to introduce the

FIG. 2. THE CALCULAGRAPH IN TELEPHONE SERVICE.—VIEW OF INSTRUMENT COMPLETE.

calculagraph into this service, and arrangements were made to conduct extensive experiments in a New York exchange. Several instruments were placed in actual service, and during the last year they have been relied upon absolutely not only in "long-distance" service, but in the "toll" department of the local service. In the accompanying cuts Fig. 1 gives a partial view of the switchboard of the American Telephone & Telegraph company at New York, equipped with these instruments, and Fig. 2 shows the appearance of a single instrument completed and ready for service. It should be mentioned in this connection that the calculagraph is a combination of a clock and recording apparatus by which mechanical calculations and printed records of the net results are made. Tickets are used upon which the several records required are stamped. Specimen records are shown in Figs. 3 and 4, these cuts being reproductions of tickets used by the Central Union Telephone company, and in Figs. 5 and 6 two additional forms are given, by which it will be seen that calculations of money earned at any standard rate per unit of time can be produced as readily as the record of the time occupied in a telephone conversation. This, it will be readily understood, makes the instrument applicable to many fields, including messenger service, billiard and pool rooms, livery, bicycle and boating companies, as well as in factories and shops employing many operatives and clerks.

Returning to the subject of telephone toll service, it is admitted by the managers of large exchanges that thus far it has met all the requirements of service. The instrument, can be used by operators without special training, as the method of operation is very simple. At the beginning of a message the ticket is inserted in the slot at the front of the instrument against the guide and is shoved to the right until it fits in the corner. The right-hand lever is then pushed backward and forward; this records the time of day and also makes an impression of the two dials at the left, but not of the pointers, Fig. 3. At the end of the message the ticket is again inserted in the slot in the same position as before and the left-hand lever is pulled forward, thus printing in the center of the two left hand dials the two pointers, as shown in Fig. 4, which will point toward the figures which represent the exact length of time which has elapsed since the first impression was made.

Thus, it will be seen, these instruments record the time of day a connection is made for a conversation, the time which elapses between the first "ring-up" from the subscriber or the local exchange to the time when the person wanted at the distant city is secured and communication is completed between the two persons who wish to talk, the time which elapses during the actual talk, on which time the charge is based according to the distance covered, and the time which elapses during an interruption of a conversation from any cause, so that the interrupted time may be deducted from the total elapsed time, in making the charge to the customer. It will thus appear that for the telephone service of the American Telegraph & Telephone company the calculagraph performs four separate and distinct offices. Long-distance exchanges have been equipped with these instruments at New York, Boston, Providence, Troy, Buffalo, Philadelphia, Pittsburg and Chicago, and many local companies in the cities already named and in others have begun to use these instruments in local and suburban service. The parent company is known as the Calculagraph company of No. 2

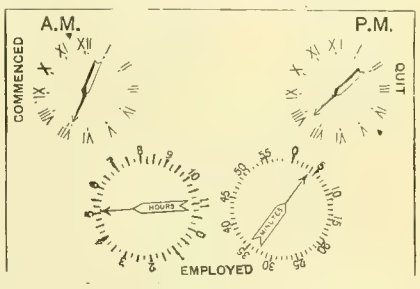

FIG. 6. THE CALCULAGRAPH IN TELEPHONE SERVICE.—RECORD OF TIME EMPLOYED.

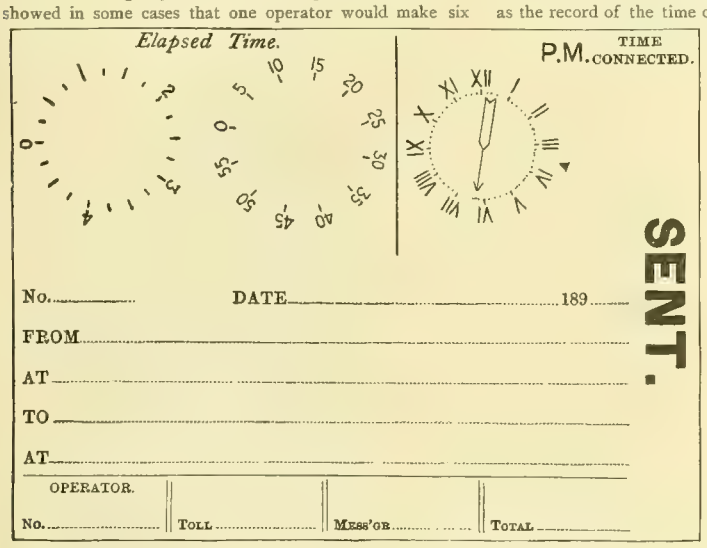
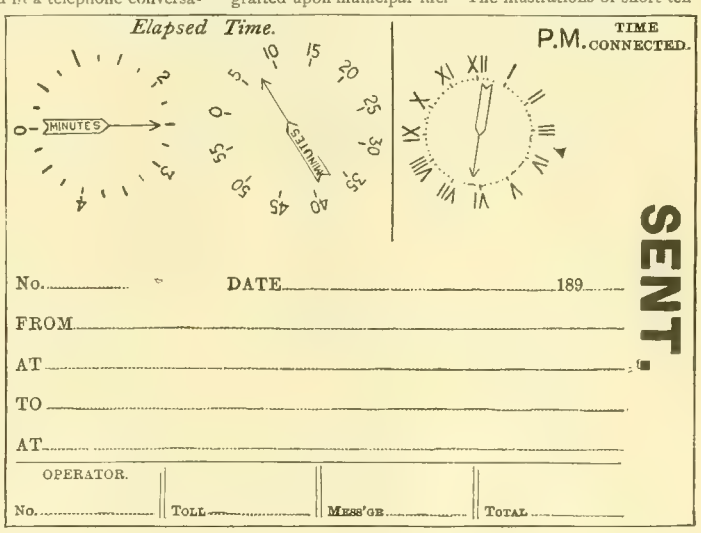
Maiden Lane New York. The Pope Manufacturing company will represent the company in Chicago.





FIGS. 3 AND 4. THE CALCULAGRAPH IN TELEPHONE SERVICE.—TICKETS USED BY CENTRAL UNION TELEPHONE COMPANY.

## Mr. Yerkes' Views on Municipal Ownership Commended.

[From the *Chicago Chronicle.*]

Though Mr. Yerkes' motive in decrying municipal ownership of street car plants is obvious, yet his statement in the main is correct.

It is idle to talk of municipal ownership of gas companies or street car lines until the merit system is thoroughly engrafted upon municipal life. The illustrations of short tenure of employes under the municipal system and the extravagance in the number of employes before elections, indeed the various objections and illustrations made by Mr. Yerkes against the general suggestion of municipal ownership, are true as the case stands. But if after many years' experience of a real merit system the municipality should conclude to enter the domain against which Mr. Yerkes as a public-spirited citizen makes protest, the story would be altogether different.

Socialism is involved in the proposition that the city shall control its own streets in the common interest. It is limited and beneficial socialism. But the conditions must be just right before it can be made a success. Not in this generation would it be possible for the municipality thoroughly, economically and satisfactorily to operate street cars or gas works.

## The Multipolar Series Reversible Mill Motor.

For operating heavy machinery in rolling mills and foundries, for swing-bridges and traveling cranes—in fact, in all places where a strong, simple and serviceable machine is required—no power can be more adaptable than the electric motor. The accompanying cuts show the Card series reversible multipolar motor and controller, manufactured by the Card Electric company, Mansfield, Ohio.

Fig. 1 shows the motor completely enclosed; thus the machine can be used in places where the open type of motor would soon be destroyed. This motor, in connection with improved controller and current regulator, makes a very desirable outfit for operating traveling cranes, turnbridges, hoists, bending rolls and other kinds of machinery which require various speeds in either direction. Attention is called to the method of mounting this motor for general work. The front of the motor is supported on a cast-iron stand rigidly fastened to the bed-plate of the machine or other foundation, with trunnions on each side of the upper part, taken through suitable bearings on the motor case, forming a pivot for the motor to swing on. The rear part of the motor is supported on springs at each side, with springs above, held in compression by bolts through the pedestals, which support them and which are also fastened to the bed-plate. The object of this arrangement is to provide a flexible support for the motor and a cushion for the gearing when heavy loads are thrown on the motor or the direction of rotation is suddenly reversed. In practice it has been found to work admirably, and, in addition to saving the gears, gives the motor a noticeable advantage in starting heavy loads at slow speed. Where the conditions are such that the spring suspension is not advisable, brackets are provided on the motor for bolting to the bed-plate or foundation rigidly.

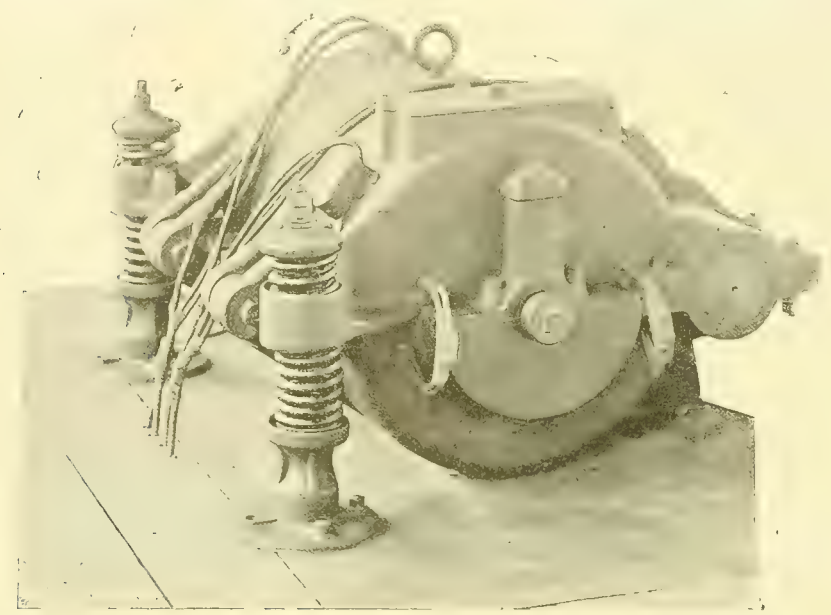


FIG. 1. THE MULTIPOLAR SERIES REVERSIBLE MILL MOTOR.

To satisfy the class of work for which this motor is designed, nothing but the best material can be used with safety, and the construction must be as thorough and complete as it is possible with modern tools to make it. Special pains have been taken in the design to provide large bearings for the armature shaft and other parts subjected to strains and wear, and in every part a generous excess of metal is allowed for mechanical strength and as a factor of electrical safety.

Fig. 2 represents the controller with the lever in a vertical position for current "off" and the door open, exposing the mechanism for regulating the current. Fig. 3 shows the back removed, exposing the wiring and connections to contact fingers. The controller is strongly put together and finished with iron filler or japan, as desired. The working parts have received the most careful attention. They are practically self-contained, and with the exception of the operating lever are fastened to a back made in one piece, which can be removed from one case to another without disturbing any of the parts. Each controller is provided with two revolving cylinders, geared together and operated by the lever, at the top of which is fastened a series of contact rings. The one at the right is used exclusively for opening and closing the circuit and has 24 contacts. These contacts are so arranged with reference to the motor winding that arcing is impossible. A separation of one-sixteenth inch between rings and contact arms will open the circuit without carrying current across. The cylinder at the left carries the reversing rings and others for regulating the flow of current through the motor. Of these there are 10, and the resistance between them is so proportioned that no spark follows when a change is made, no matter how slowly the lever is moved. Near the bottom of the controller is a series of binding blocks for making connection to the motor, current regulator and the line. These binding blocks are plainly marked with letters and figures and correspond with others on the motor and regulator. With each controller the company sends a diagram of the wiring. The cylinders for starting and regulating the current are compact and strong, with ample insulating resistance for use on any circuit up to and including 500 volts and have sufficient metal in the contacts to carry a large excess of current without heating.

## The Abendroth & Root Company's Legal Victory.

On November 19th action was begun by the Philadelphia Edison Electric Light company of Philadelphia against the Abendroth & Root Manufacturing company of New York, to recover $34,000, and a countersuit was filed by the Abendroth & Root Manufacturing company against the Philadelphia Edison Electric Light company for $6,830.99. This suit was tried in the United States Court in Brooklyn, before Judge Wheeler and a jury, and a verdict was given in favor of the Abendroth & Root Manufacturing company for the amount of the countersuit.

The Abendroth & Root Manufacturing company manufactures the Root water-tube boiler, and between the years 1889 and 1891 furnished the Philadelphia Edison Electric Light company about 3,500 horse power of boilers, these boilers being supplied on four different contracts, each of which followed the other at short intervals.

Soon after these boilers were erected and in operation in the Philadelphia Edison plant, a series of troubles followed, which finally culminated in a fatal accident. This brought the matter into the Coroner's Court in Philadelphia, where, after a careful investigation by a jury of experts, a verdict was returned acquitting the Abendroth & Root Manufacturing company and holding the Philadelphia Edison Electric Light company responsible.

The troubles mentioned were due, as claimed by the Philadelphia Edison Electric Light company, to bad workmanship, bad material and faulty design, and also to the contractors failing to comply with all the articles agreed upon in the contract, and on these grounds the complainant brought the suit just closed, in which it sought to recover $34,000, which it claimed it had spent in remedying the so-called defects. The Abendroth & Root Manufacturing company claimed that the plaintiff had not paid them all that was due on the orders for boilers, and also for additional material furnished, and on these grounds brought the countersuit mentioned.

The Abendroth & Root Manufacturing company succeeded in the first place in establishing the fact that it had lived up to every article of its agreement and had even done more than it agreed to do.

In the second place it succeeded in establishing the fact that it had used the best material obtainable in the market. In this connection it is interesting to note that the greatest number of breaks occurring in these Edison boilers were reported to be in the item of bolts; and as it is a natural conclusion that the greatest breakage will occur at the weakest point, it was necessary to establish by evidence the fact that these bolts were equal, if not superior, to anything to be found in the market. When these bolts broke, in almost every instance a curious phenomenon occurred. At the point of fracture, the metal, instead of being contracted to a smaller area than that of the bolt itself, retained the original size and area, showing no contraction whatever,

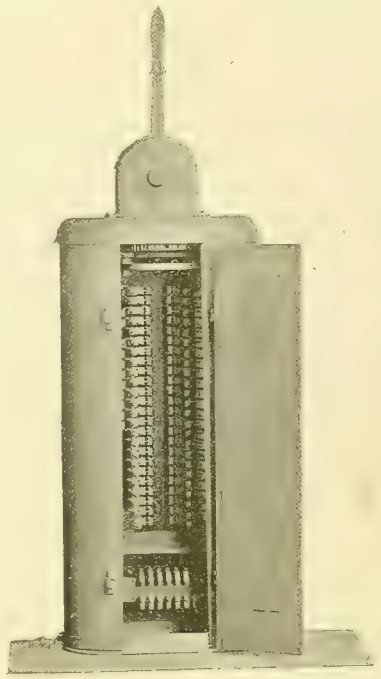

FIG. 2. THE MULTIPOLAR SERIES REVERSIBLE MILL MOTOR.

but breaking sharply and squarely in a similar manner to a pipe-stem. This caused the question to be raised as to whether crystallization had occurred, and to determine this point, many of these bolts were taken to a steam hammer and flattened out cold to less than one-quarter of an inch in thickness. In every instance the flattening was done without the slightest show of fracture running up into the body of the bolt, whereas if crystallization had taken place at the point of rupture the metal would necessarily show brittleness and breakage similar to the action of a piece of cast-iron similarly treated. Another test applied to many

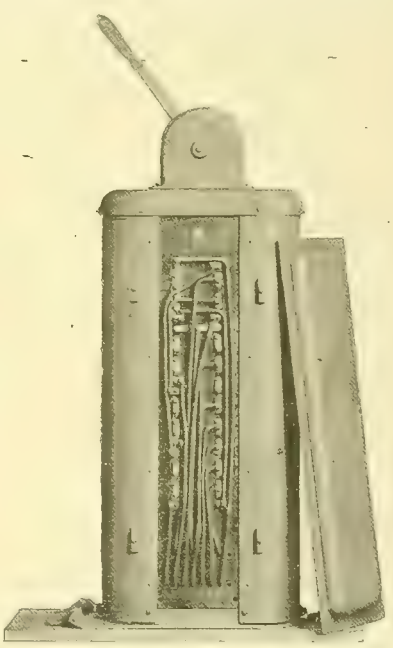

FIG. 3. THE MULTIPOLAR SERIES REVERSIBLE MILL MOTOR.

of these bolts was to bend them double when cold so that the two ends met, and this also proved the excellence of the quality of the bolts. In order to show that no effort had been spared to improve the quality of the material used, the Abendroth & Root Manufacturing company had other bolts made of the best rivet iron, substituted in the place of the original ones, but all such bolts were fractured in identically the same manner, and a still further trial was made with steel bolts, which were affected with the same

results. In order to make this breaking point test still stronger, three-quarter inch bolts were substituted for the five-eighths inch bolts, but with no better results. Beyond this, the shape of the head, and also the shape of the lug which received the head of the bolts, were changed in every conceivable way, but all to no avail, as the fracture of bolts continued in this almost unaccountable manner, whereas fracture in the other parts of the boiler was very infrequent indeed. It follows that no better evidence could be furnished or was needed that good material was used throughout.

To answer the allegation of bad workmanship, the Abendroth & Root Manufacturing company, which has always been very jealous of its reputation, showed by means of photographs the tools which it now uses in the manufacture of boilers, and proved that these tools had been used in manufacturing all of the boilers supplied to the Philadelphia Edison company. As these tools are made to produce interchangeable parts, with cutters and other working details fixed immovably in the same position and adjusted to such positions by sets of templets carefully standardized, and further as the positions of the metal parts of the boilers were fixed from working points produced in the casting, it was found impossible for the plaintiff to show that such workmanship could be other than that produced in the many boilers manufactured by the Abendroth & Root Manufacturing company. Moreover, as such trouble as was experienced in the Philadelphia Edison station has never been known in other plants, it stood to reason that, with workmanship and materials the same, all the troubles at the Edison station must have been due to local conditions existing in the plant itself. This same argument bore also on the fourth claim of bad design.

Futhermore, the Abendroth & Root Manufacturing company succeeded in proving that the accidents were due entirely to the unreasonable handling of the boilers by the Edison company, with the object of forcing these boilers far beyond their rated capacity, sometimes exceeding this rating by as much as 100 per cent. and over. It also showed that the Edison company employed unskilled labor, and that these employes had instructions to keep steam up to the required pressure irrespective of any demands that might be made on the boilers, and that the whole idea was to keep the lights going which the Edison company had contracted to supply, without regard to the personal safety of the attendants or capacity of the boilers.

One of the very important matters brought to light in this case, and acknowledged by the Edison company, was the use of extremely bad feed-water. It seems that the Edison company sunk a well beneath the station, and this was the only water used to supply the station. This water, as was shown by the analysis presented during the trial, contained not a small amount of sewage, and ran 34 grains of impurities to the United States gallon, almost 8 per cent. of these impurities being proved to be sulphate of lime; while salt existed in appreciable quantities, and also a number of nitrates and ammoniacal salts. This water was what might be called the surface drainage of the city of Philadelphia, and as the city has, unfortunately, a very poor sewerage system, this drainage amounts to what might be regarded as sewer water which had undergone a certain amount of filtration in the earth down to the impervious strata along which it ran and finally collected in this well. In order to counteract the bad effects from this water, no small amount of chemicals was used. These were changed at times, and finally the Edison company seemed to settle down on the use of cutch, or what is more properly known in chemistry as catechu, which contains a considerable quantity of tannic acid. In the storage tank located above the boilers large quantities of caustic soda were also put in the water, making so strong a solution that water dripping from it would take the hair off of the horses that passed beneath it, also inflicting serious burns upon the workmen who were so unfortunate as to catch a sprinkle. The result of the use of this bad feed-water was naturally shown in the collection of a large amount of scale in the tubes, varying in thickness from five-sixteenths of an inch to one inch, and thereby closing down very materially the area of the tube opening. The chemicals used attacked the metal parts of the boiler and oozed through the joints thus attacked so as to form incrustations, which had at times almost entirely covered the bolts and bends. This incrustation proved so hard that the workmen were obliged to use a hammer and chisel to remove it. This state of affairs caused a rigidity of parts which were designed to be flexible, and it also caused the unnecessary burning out of many of the tubes.

Another very important point established by the evidence was that an excessive forced draft was used in order to drive the boilers to the unreasonable extent to which they were used, and evidence showed that this draft was sufficient at times to support a column of water from three to four inches in height.

Several well-known experts appeared in this case and accounted for the various troubles here enumerated. One of the most interesting points developed was the production of water hammer in the tubes of these boilers, which was explained in the following manner: It is a well-known fact that every pipe or tube has a definite capacity of discharge, and when this capacity is reached no more water or steam can be delivered through an opening of such an area; so that in case a larger discharge is required, a larger tube must be used. In driving these boilers to such an excessive extent, in the course of natural circulation the water and steam passed up along the inclined tubes to the front headers and there advanced upward into the overhead steam and water drums from which the steam was delivered to the piping system. When the circulation reached a point equal to the capacity of the tube, of course no more steam or water could be discharged from that upper end of the tube, but as the heat still continued to be applied around the tube, more steam was generated, and of course the pressure of this steam in the tube forced the steam and water back down the tube until it reached the rear header and here the steam suddenly had a chance to escape upward by the course of the rear headers to the overhead steam and water drums, and the colder feed and circulating water trying to enter the lower end of the tubes from these same rear headers came in contact with the steam thus seeking passage of escape. The result was a sudden condensing of the steam, which was followed by a rush of water into the vacuum at an exceedingly high velocity, and this water rushed along the tube at about this same velocity until it reached a bend at the end of the tubes. The result was a very sudden and powerful blow there, practically like that of a cannon ball, which caused the bolts to rupture in the manner described, breaking them in fact, so rapidly that a flow of the metal composing them, at the point of rupture was impossible.

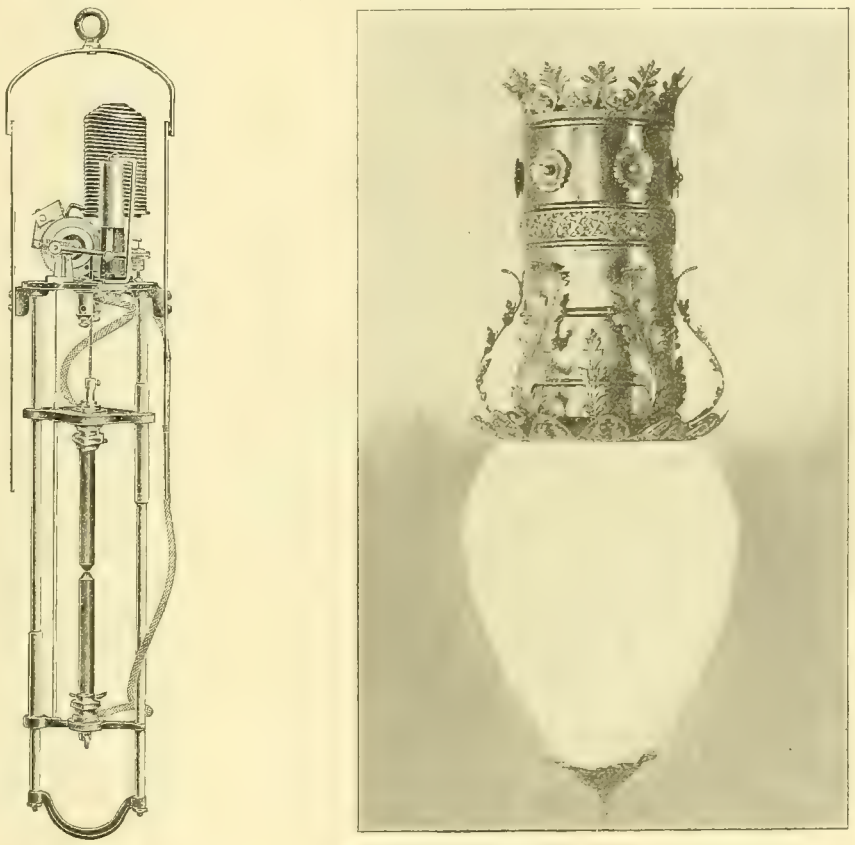
This flow necessarily would take a certain amount of time. The consequences of this sudden blow were exhibited in the breakage of these bolts without contraction of area at the point of rupture. It was remarked during the course of the trial that it was fortunate that these boilers were composed of small headers covered by small castings known as connecting bends, and that thus the damage done affected merely these small castings, producing there local results instead of rupturing large castings, which would, of course, be attended by far more serious ruptures. Glass models were shown at court which illustrated beautifully the theory thus presented. Other glass models illustrated the irresistible power of the water hammer, the force of which was sufficient to break the tubes which held the water surrounded by a vacuum.

The counsel for the Philadelphia Edison company included Tracy, Platt & Boardman, and the counsel for the Abendroth & Root Manufacturing company Benedict & Benedict and Witter & Kenyon of New York. The plaintiff brought in as an expert Prof. Spangler of Philadelphia, while the defendant brought in as experts Dr. C. E. Emery of New York and Prof. R. C. Carpenter of Sibley College, Cornell University, Ithaca. Prof. W. D. Marks of the Philadelphia Edison company and Albert A. Cary of the Abendroth & Root Manufacturing company also testified.

## Alternating Arc Lamps.

The development of alternating current appliances during the past few years has been truly remarkable. In nearly every department of lighting and power they have proved formidable competitors of the direct current apparatus, and that too against deep-rooted prejudice.

In no case has the alternating current demonstrated its adaptability and usefulness in a more striking manner than in arc lighting, especially since the carbon manufacturers have been so successful in producing a first-class article in the way of a cored carbon suitable for this class of work. The advocates of the alternating arc claim that it has all the advantages of the direct current arc, and a great many more beside. Given a lamp capable of good regulation and good carbons, and the alternating arc will produce as much light, if not more, per watt consumed, as the direct current arc. The light, too, especially for indoor use, is claimed to be far more agreeable to the eye, being softer and more evenly diffused and free from disagreeable shadows. Under white ceilings the alternating arc produces all the effects of the so-called inverted arc without the disadvantage of the deep shadow immediately under the lamp. Using the alternating arc in this manner an agreeable combination of direct and reflected light is produced. For outdoor use a reflector is desirable.



ALTERNATING ARC LAMPS.

Another development that is promised is the substitution of the large and efficient alternating unit for small arc dynamos in all large central stations. Alternating lamps can be run in series for street lighting from the primaries or from step-up transformers, and scattering customers can be supplied from transformers, and that, too, on a meter if desired.

The illustrations show a lamp designed for alternating service and placed on the market by the Fleming-Spence Electric company of 652-660 Hudson street, New York. As may be seen, the lamp is as simple as can be made. The regulation is performed by a solenoid and core acting through a system of levers on a most ingenious feeding device. This device is so constructed that it is impossible for the lamp to overfeed or burn a coil in consequence, and there is no delicate mechanism of any kind in the lamp to become clogged or get out of order. The lamp is supplied in various styles of ornamentation, some of which are extremely handsome.

Western Electrician

EVERY SATURDAY.

PUBLICATION OFFICES:

6 Lakeside Building, - - CHICAGO.

TELEPHONE, MAIN 1746.

EASTERN OFFICE: 108 TIMES BUILDING, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2 50 with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN—**the only general electrical paper published in the West**—thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

Illustrated Electrical Patent Record ..... 306

HARD times do not seem to prevent the inventive genius of the country from flooding the market with novelties and absurdities of every class and description. According to the Patent Office records there is, and has been during the last year, great activity in this field, and most of us are willing to believe that it is an indication of improvement in trade and financial affairs, but there are some who seem to think that this remarkable showing at this time lends another meaning to the old expression that "Necessity is the mother of invention."

AT this time, when merchants are resorting to all sorts of devices to attract attention and draw the crowds of sight-seers who frequent the large cities, it is well to remember that there is no attraction so interesting to the masses as a brilliant electrical display. Incandescent lamps lend themselves readily to decorative purposes, and the special forms that have been designed for this class of work make it easy for window trimmers and general decorators to utilize them. It should be borne in mind, though, that care should be taken to avoid danger from fire. The wiring should be done by competent men and in strict compliance with the rules, otherwise serious results may follow.

OF late several references have been made by the daily papers throughout the Empire State to the proposed introduction of electricity upon the Erie canal, and in some of these the impression is evidently sought to be conveyed that the problem has been thoroughly canvassed; that the engineers have concluded their work and determined that the project is economical, and that everything is now in readiness to proceed. Such a condition of affairs would be welcomed far beyond the confines of the state, but do the facts warrant these conclusions? Have competent engineers "figured" out the cost? Who are the engineers? Where are their reports to be found?

THAT is a remarkable statement by Mr. Edison which is just now going the rounds of the daily papers. "Our present patent laws," he is reported to have said, "which, as interpreted by the courts, encourage perjury and put a premium on fraud, are worse than a farce." Such a statement, coming from such a source, must create considerable wonder in the minds of those who know how much Mr. Edison owes to the patent system of this country. It is generally admitted that our patent department is not perfect, that there have been irregularities in its administration, and that injustice may have been done worthy inventors, but it seems hardly possible that Mr. Edison should assume to condemn the system in the manner and language which he is reported to have employed.

IT would require more time and study than the average business man can devote to such matters to follow the developments in the Long Island Traction controversy that is now receiving so much attention in New York city. The case has passed from the lower courts to the state Supreme Court; then to the United States Circuit Court of Virginia, and now it is back again in the state courts, and if there is anything left of the property by the time the controversy closes it will not be the fault of the legal luminaries who are at present guarding the interests of their clients. No wonder electric roads fail when they are manipulated by stock jobbers and legal sharks. In this case the property has been attacked on every possible plea, and it is not to be expected that these onslaughts have enhanced its value.

GENERALLY speaking there is an opinion that the only interest street railway companies have in the community is their ability to extract the nickels and dimes of their patrons. That this is not true will appear to anyone who will take the trouble to inquire carefully into the subject. The street railway interests are important and demand protection, and they deserve it, too, judging from their contributions to the city finances. In illustration of this fact it is only necessary to mention one case which is reported in the daily papers of the East, and which does not seem to have attracted especial attention among those who are constantly denouncing street railroad corporations. The taxes on the property of the Brooklyn Heights Railroad company this year amounted to $195,000. It is said that there is not another corporation in the city of churches which contributes so large a sum toward defraying the public expenses.

ONE is compelled to admit the force of the remark that there is nothing new under the sun when such experiences are related as that detailed by Ralph W. Pope in his interesting contribution this week entitled "A Magnetized Watch in Early Days." A few years ago there was as much interest displayed in non-magnetic watches as there is at present in the underground conduit railway. The subject was a fad, and people thought at that time that they had discovered something new, but in this they appear to be mistaken. Mr. Pope relates a story connected with his brother's early experience in telegraphy which establishes pretty clearly that the same trouble was met, recognized and overcome forty years ago as has of late occupied so much attention. The experience, as related in another column, is interesting and should be especially instructive to those who fail or refuse to recognize the work that was done in the early days when telegraphy was the chief branch of commercial electricity.

OF late there have been several accidents on steam railroads which have been attributed to neglect or poor judgment on the part of the interlocking men, and this has directed especial attention to the necessity of surrounding the interlocking crossings with every device obtainable that will provide additional safety. A recognized authority on steam railroad equipment and management, commenting upon a recent accident at an interlocking crossing, said: "The average towerman is liable to errors of judgment and also to absent-mindedness to a surprising degree, and even if this were not the case it is necessary to so surround interlocking plants with safe guards as to make it impossible that such derailments should occur. It is within the limits of reasonable cost by adding electric locking to render ordinary plants perfectly and entirely safe from such accidents as this one, even if the trackmen carelessly fail to maintain the gauge." In view of the attention that is being given to this subject by steam railroad men, the paper by W. H. Elliott on "Electric Locking Circuits for Interlocked Crossings," which is printed on another page this week will be read with additional interest by those who have given especial attention to this class of work. It has been an up-hill fight for inventors to secure recognition and co-operation in their experimental work from railroad corporations, but now these concerns seem to recognize the necessity of developing a thoroughly practical system, and there is no doubt that with the encouragement and assistance they can lend great progress will be made at once.

ONE does not expect much from such a publication as the *Electrical Journal*, but occasionally there is a display of ignorance on the part of the "professor" and the "doctor" in discussing matters of general interest that is astounding, even considering the source. In the last issue, for instance, reference is made to the recent decision of Judge Townsend in the Van Depoele patent cases under the heading: "Underground Trolley Litigation—Thomson-Houston Company Wins a Suit Against Winchester Avenue Railway." But this is not all. Further misinformation is presented as follows:

Judge Townsend, in the United States District Court, has rendered a decision in the case of the Thomson-Houston Electric company against the Winchester Avenue Street Railway company by which the claim of the plaintiffs to the Vanderpoel patents is sustained. The suit was in reality an issue between the General Electric company and the Westinghouse company and called for a perpetual injunction restraining the use of the underground trolley on the Westinghouse roads. The injunction, it is said, gives to the General Electric company the exclusive right to manufacture and sell the underground system. The case will be appealed to the United States Supreme Court.

The facts in the matter are that Judge Townsend, of the United States Circuit Court, at New Haven, Conn., on the 7th inst. handed down a decision by which Van Depoele patent No. 495,443 was sustained, and No. 495,383 declared invalid. These patents are owned by the General Electric company, and the suit was really directed against the Westinghouse company. The patents cover the overhead underrunning trolley and have nothing to do with underground trolleys whatsoever. By the way, the great inventor's name was Van Depoele and not Vanderpoel. This little incident will serve to show how little dependence can be placed in any statement made by Barrett or Hornsby. Through ignorance or perversity they manage to distort and misrepresent facts to suit their convenience.

NOT only North Side merchants, but businesss men and shoppers in every part of the city, are complaining of the poor service that is being furnished by the electric street lighting bureau of the city of Chicago. Even in the down-town district the city street lights are constantly going out, and important thoroughfares are left in total darkness for hours at a time. Here is a sample of the complaints, taken from the *Chicago Tribune* of last Sunday:

Until eight o'clock last night there were no street lights in the down-town district west of Clark street.

Except for the light furnished by the Edison and other private companies the streets were not illuminated, and pedestrians who walked to the West Side or took the Metropolitan "L" trains were compelled to go through dark streets.

Yesterday workmen and electricians were repairing the circuit which furnishes the city lights in that district, and the work was not completed until nearly eight o'clock.

Again on Monday night darkness reigned on the South Side. The *Chicago Record* tells of one instance where a foot pad attempted to "hold up" Dr. Ebert of Michigan avenue when returning to his home. He was attacked on Peck court Monday night just west of Michigan avenue, and when he resisted was fired upon. Fortunately the bullet missed the mark. Dr. Ebert is indignant because the city does not provide safe thoroughfares upon which citizens can safely walk after dark. The *Record* says:

Dr. Ebert said yesterday that he had made repeated complaints to City Electrician Barrett about the illy lighted condition of Peck court between Wabash and Michigan avenues.

This is not the only district that has suffered, and the North Clark street merchants are not the only shopkeepers who have found it necessary to provide street lights and cease to depend upon the city service. Such an outrageous state of affairs is unknown in any other city in the country. And still Barrett has the audacity to seek further extension of the system.

## Coupling Compound Machines in Parallel.

It is generally conceded that two compound wound machines, A and B, will furnish equal amounts of current at the main bus-bars of the board when they satisfy the theoretical condition—

$$\frac{u}{u^1} = \frac{r+R}{r^1+R^1}$$

u being the potential in the armature, the winding being in series and the cables connected to dynamo A; $u^1$ the corresponding potential for dynamo B; r the resistance of the armature of A; $r^1$ that of the armature of B; R the resistance of the series winding and the connections of A; $R^1$ the corresponding resistances of B.

In these conditions, says a foreign exchange, the two machines should act perfectly in paralled. But this state of things is not thoroughly constant, for the least variation of one of these quantities will result in giving one of the dynamos an advantage which may change the second into a motor. It is common practice to unite the positive brushes by a cable of feeble resistance, but this arrangement, while guaranteeing against the reversing of either dynamo, does not completely prevent the change from dynamo to motor, as under some circumstances the transforming current may cross at the brush connections.

The employment of this connection vitiates the formula of equality above, save when

$$r=r^1 \text{ and } R=R^1$$

and consequently $u=u^1$, if the action of the machines is such that normally no current flows from the one machine to the other.

Now, consider the case where the resistance of the armature r of A is superior to that of $r^1$ of B, and assume the resistances of the series windings, etc., are equal and the machines develop equal currents. The potentials in the two armatures are respectively Ir and $Ir^1$. As we have $r > r^1$, the difference of potential at the brush of B will be greater, and it will flow through the special connection, the brushes and the series winding of A, a current flowing to the bus-bars. Consequently the ammeters at the board will show for A an intensity greater than that of B, while in reality the two machines are developing equal currents.

Consider now the case where, the armatures having equal resistances, the series winding and the connecting cables of A are superior to those of B, and suppose that the ammeters indicate equal intensities. Here the potentials are IR for A, and $IR^1$ for B, and as we have $R>R^1$ the potential at the brushes of A should be superior to that at B, and a current should flow through the special connection from A to B. Then the ammeters will indicate equal intensities for the two, when in fact the difference of current furnished by the armatures may be considerable.

Thus we see that ammeters in the machine circuits of compound dynamos operating in parallel, when these are between the brush and its connection with the series winding, are not thoroughly reliable.

To readily equalize the current between the machines, then, it is absolutely necessary to adjust the relative resistances perfectly. Feeble differences of potential at the extremities of the special connection may determine currents of great relative intensity, because of the low resistance of the connecting cable.

In some installations for illumination the dynamos are regulated by their speed, and so adjusted that no current shall flow over the special connection. In this case the relative resistances of the armatures may be disregarded as far as equalization is concerned, and it suffices to adjust the resistances of the series winding and the connection cables in inverse ratio to the fixed maximum output of the machines, to obtain the intensities desired.

The neutral condition of the special connection may be readily shown by means of a simple upright polarized needle within a coarse coil, mounted in derivation upon the special connection. The needle will remain at zero when no current flows, but will indicate at once when the balance is disturbed by pointing to the machine furnishing the current. The speed of the machine is then changed until the equilibrium is restored—quite a simple matter with well regulated machines.

## Electric Locking Circuits for Interlocked Crossings.[1]

By W. H. Elliott.

In locking electrically the levers of an interlocking machine and taking the control out of the hands of the operator after a route has been set and the signals cleared for an approaching train, the use of the crossing is undoubtedly made much safer, as the operator is then unable to change any of the levers that would lead to a derailment. By locking the levers of the derails only, the operator is free to return any signal to danger at any time, and by so doing endeavor to stop a train, should it be a desirable thing to do, but more than this he cannot do. By locking the levers electrically, it is also impossible for the operator to willfully, or through carelessness, cause any damage to the interlocking by opening a derail or switch for a train or engine to run through trailing the points. There are several ways in which the locking of the levers may be accomplished, that which is suitable for one crossing not being applicable to others without going to too great expense, so that with each application the details of the arrangement must depend to a great extent on the nature of the crossing.

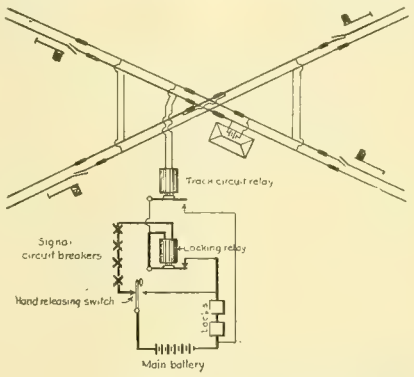

FIG. 2. ELECTRIC LOCKING CIRCUITS FOR INTERLOCKED CROSSINGS.

Probably the first in this field in this country was the Union Switch & Signal company, which strongly advocated the use of electric locking, a proposition being regularly made in their bids for putting in an electric locking device. Finding, however, that owing to the cost it was seldom or never wanted, they, while believing it was a good thing, have not pushed it to any great extent.

The arrangement used by them to lock the lever consisted of an electro-magnet, inclosed in a box and attached to the front rails of the machine in such a manner that when the armature was dropped, it would fall into a notch cut in the outer edge of a disc attached to the flop of the lever it was desired to lock, locking it when the lever was reversed, the circuit through the magnet having been broken by the reversal of the lever. To effect a release, a track circuit placed beyond the limits of the interlocking was used, which was so arranged that not until a train had passed entirely off of the circuit and, therefore, out of the limits of interlocking, could any change of the levers be made. For single track crossings, when a train running toward the crossing would release the locks before reaching the interlocking, mechanical interlocking relays were used, which, by means of a track-locking circuit, prevented the completion of the releasing circuit, until the train had passed entirely over the crossing and off the locking circuit. This virtually accomplished all that was desired with any arrangement of circuits, so that the only claim made for those about which this paper is written is, that no mechanical interlocking relay is used, and the number of circuits has been reduced as much as is possible while accomplishing the end desired.

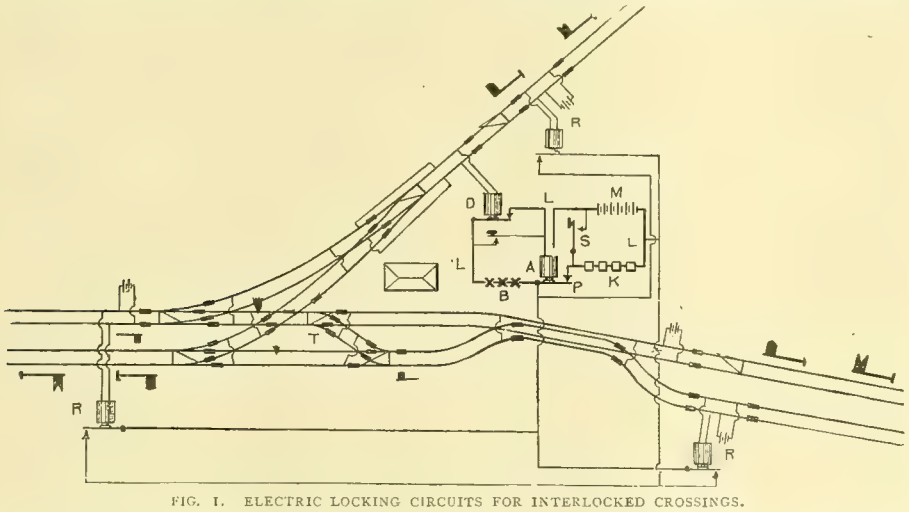

FIG. 1. ELECTRIC LOCKING CIRCUITS FOR INTERLOCKED CROSSINGS.

By doing away with the interlocking relay the releasing is effected entirely by electrical means and there is no chance of the points sticking and failing to release, nor is there any chance for the locks to to be released before they should be by the operator jarring the relay box. In the arrangement shown in Fig. 1 five different circuits are made use of, one a track-locking circuit *T*, a second a locking circuit *L*, used to energize the electro-magnet of the locks and keep them unlocked, and the other three, releasing circuits which are marked *R*, and are used to restore the locking circuit after it has once been broken, thereby lifting the lock armatures and releasing the levers. The locking circuit *L*, which for the sake of distinction is shown in heavy lines, is made to pass through the locking magnet *A*, through the contact points *P* of the relay armature, through the contact points of the armature of the relay *D*, through the locks *K*, through the circuit breakers *B* and the releasing switch *S*, *M* being the battery of about 12 cells, used to energize the magnet *A* and the locks *K*, whenever the circuit is complete. The locks being released and the armature of the relay *A* held up when the circuit is completed, any break in the circuit, as will occur at the points *D* and *B*, will, of course, drop the locks and also the armature of the relay *A*, the armature breaking the lock circuit at the point *P* and preventing the locking circuit from being restored, even if the circuit was again made good at the point where it had previously been broken. To restore the circuit, the relay *A* must be again energized, when the armature would be lifted and a contact made once more at the point *P*. To energize the magnets, a shunt circuit through the points of the releasing relay *R* is used, which bridges the gap made by the points *P* and completes the locking circuit from the battery to the relay *R*, the magnet *A*, the circuit breakers *B* and the switch *S*, the armature of the relay *A* being raised and the circuit completed once more through the points *P* and the locks. But as the resistance of the locks is greatly in excess of what it is through the shunt circuit, not enough current will pass through the locks to energize them so long as the shunt circuit is completed, and they are, therefore, lifted only after the shunt circuit has been broken. From this it will be seen that by passing the locking circuit through the contact points *P* of the relay *A*, and around the locks, the control of the circuit is taken out of the hands of the operator, for while he may break the circuit and lock up the machine at will, he is powerless to restore the locks and must wait for the train to pass out of the interlocking to release the levers.

The releasing circuits, of which there are three, one for each track on which trains usually pass out of the interlocking, are only 60 feet in length, the relay being energized and the armature held up so long as there is no pair of wheels on the track to form a short circuit. When the relay is short-circuited the armature falls and makes a back contact, completing the shunt circuit through the locking magnet *A*, around the locks and restoring the locking circuit in the manner spoken of. As the circuit is completed without passing through the locks, they are not released until the locking circuit through the releasing relay has been broken, so that as long as there is a train on the releasing circuit and the relay is demagnetized, the machine is still locked up. This insures that not only must a train have reached the releasing circuit but must pass out of it before the levers will be released. The track locking circuit energizing the relay *D*, the armature of which when down is made to break the locking circuit and prevent the locks from being released, is used to prevent a train passing over a releasing section on one track from releasing the locks before a train which may be on one of the other tracks has passed out of the interlocking. In this way an operator is prevented from making a mistake and changing the switches in front of any engine that may be working within the limits of the interlocking, and which, for the moment, he may have overlooked. The circuit breakers, *B*, one of which is provided for the lever of each home signal, are used to break the circuit and lock up the machine whenever a home signal is cleared, thus insuring that while the signal may be returned to danger at any time, no change can be made in the switches of the route that has been set. As the locking circuit is the one which is broken when the home signal is cleared, the circuit will, of course, not be restored and the locks released when a train passes out of the interlocking if the signal has not been returned to danger before the last car has passed off the releasing circuit. This means that an operator must attend strictly to his duties, or else he may be caught with the machine locked up when there is a train waiting to use one of the other tracks of the crossing. In case of a failure of the circuits to release, a releasing switch is provided which may be closed and the levers unlocked. This switch is enclosed in a locked box having a piece of glass set in the cover, which the operator has to break before he can get at the switch to close it. In this way a check is had upon his attention to his duties, as every glass broken has to be accounted for and a good reason given, a failure of the apparatus being the only excuse accepted. A second switch enclosed in another box, which is of the same construction as the first, is provided, which when closed will do away with the track-locking circuit without throwing the locking entirely out of service. As it is a somewhat difficult matter to maintain a track circuit where there are many pipe and wire lines crossing under the rails, nine out of 10 cases of failure being caused by some trouble with the track circuit, the use of this switch will be found to give almost the same protection as with the track-locking circuit in use, while admitting of the use of circuits that will seldom or never fail. If at any time changes in the rails or repairs to the interlocking are being made, this switch can be closed by the repairman and the locking feature for the greater part be maintained.

Having described in detail the circuits and the different parts used in locking the levers, the order in which the several operations take place when a train is admitted to and passes out of the interlocking are as follows: When the home signal is cleared the locking circuit is broken by the circuit breaker *B* and the locks and armature *P* of the relay *A* dropped, the armature of the relay *D* be-

1 Read before the Railway Signaling club, November 12, 1895.

ing also dropped as soon as the train reaches the track-locking circuit. When the train reaches the releasing circuit $K$, the armature of the releasing magnet $R$ drops, making a back contact, and completes the locking circuit around the point $J$ as soon as the circuit is restored at the other points where it has been broken. If the operator has restored the home signal to danger, as soon as the train passes off the track-locking circuit the relay $D$ is energized, allowing the circuit $L$ to be completed by the releasing relay when the train has passed on to the releasing section. Completing the circuit $L$ energizes the magnet $A$, attracting its armature and completing the circuit at the point $P$, but without lifting the locks. On the passage of the train off the releasing section, the relay $R$ is energized, breaking the shunt circuit and forcing the current to pass through the locks, releasing them, the levers being left once more under the control of the operator.

Where it is desired to lock the levers of a plain crossing interlocking, a much simpler arrangement can be used than the one described, while practically the same results may be obtained. This arrangement is shown in Fig. 2. As will be seen, only two circuits are used, the track-locking circuit being done away with and the one releasing circuit being made to act as a locking as well as a releasing circuit.

All the other parts, the locking circuit, the locking relay, the circuit breakers, the locks, the hand releasing switch and the shunt circuit through the back contact of the releasing relay are the same as with the arrangement first explained. Using only one track circuit and that a releasing circuit, does not change the action of the locks in any way, as the locks are not lifted in either case until the train has passed off the circuit, which is practically out of the limits of the interlocking. For very complicated crossings where no switching is allowed without the train passing each time outside of the derails, this arrangement will undoubtedly answer all practical purposes, and at the same time be very easy to maintain and cost but little to install. For a plain crossing, such as is represented in Fig. 2, the total cost need not be more than $150, although if the crossing was made at a right angle it would probably cost more, a different system of wiring being required.

## Moonlight Schedule for January.

The moonlight schedule for 1896 has been issued by the WESTERN ELECTRICIAN, and, as usual, there has been a great demand for these reliable tables. The schedule for January is herewith reproduced:

| Day of Month. | Light. | Day of Month. | Extinguish. | Number of Hours. |
|---|---|---|---|---|
| | H.M | | H M | H.M. |
| 1 ... | No light. | 1.... | No light. | 0.00 |
| 2.... | P. M 5.10 | 2.... | P. M. 3 00 | 2 50 |
| 3.... | " 5.10 | 3.... | " 9.10 | 4 00 |
| 4 .... | " 5.10 | 4 .... | " 10.30 | 5 20 |
| 5.... | " 5 10 | 5 .. | " 11 4 | 6.30 |

## Street Railway Strike in Philadelphia.

The street railway employes of Philadelphia met on December 11th, and formulated a set of rules to be submitted to President Welsh of the Union Traction company on Monday. They declare for 10 hours work and $2 a day; all cars must be vestibuled so as to protect the motormen; all trippers must get increased pay.

A later dispatch states that a general strike was begun on Tuesday. All the lines in Philadelphia are affected, and about 4,000 conductors and motormen refused to work. It is reported that the trolley mail cars will not be interfered with.

H. C. Fairfowl writes from Salem, Ill., to the WESTERN ELECTRICIAN as follows: "The question of issuing bonds for the purpose of constructing an electric plant for lighting purposes is being agitated in this city. There is no doubt that the bonds will be issued. We would like representatives of electric companies to submit plans and the cost of construction of their several plants. We should be pleased to answer any questions."

## Power Consumption on Electric Railways.[1]

BY A. K. BAYLOR.

The subject of power consumption on electric railways se ms to naturally divide itself into two parts—first, the apparatus itself, its efficiency and general construction; second, the handling of apparatus. Properly, a consideration of this subject should start with the coal pile, but it is proposed here to consider it merely in its relation to the electrical apparatus, taking the power as it comes from the engine shaft.

One of the first questions bearing on the efficiency of the generating plant that must be considered is whether direct-connected or belt-driven generators are to be used. In a paper recently read before the Pennsylvania Street Railway association, the writer pointed out that the experience of the last two or three years has shown direct connection to have, in most cases, everything in its favor, and that where land values are high and the units large, these two points alone will dictate the choice of the type of machine.

It was at first supposed that the great fluctuation of load, inevitable in railway work, would introduce a serious menace to the unit (*i. e.*, the engine and generator) when the two were rigidly connected; but this has been shown by repeated experience to be a negligible factor when a properly proportioned flywheel is introduced between engine and armature.

In comparing the two types of machines, the first consideration is apt to be the relative cost. As a direct-coupled generator is usually designed to give a certain output while running at slower speed than a belted generator for equivalent output, it must be large and cost more than the belted machine From this difference in cost, however, must be deducted the expense of belts, and several other money-saving features must be considered.

The direct-connected machine takes less room, saving land and permitting the use of a smaller building. Only one foundation is necessary, instead of two, and although the one foundation must be larger than either of the two necessary for a belted unit of equal power, it will usually cost less than the sum of the two

Furthermore, there are fewer bearings and wearing parts to care for, and last, but not least, a saving in efficiency of from 5 to 6 per cent., according to the proportion of load on the generator. This difference in percentage is due to the fact that the least possible friction loss due to belting is in the vicinity of 4 or 5 per cent., and even if this minimum is preserved at full load, it becomes about 8 or 10 per cent. when the generator is running at half load. These considerations will usually effect a decision in favor of direct coupling, unless they are offset by a saving in interest charges due to an unusually low-priced belted generator.

The next point to be considered seems to be the proper division of the plant into units. Generally speaking, perhaps the best investment is made by the installation of three units of equal size, two of which are capable of carrying the full load. This permits efficient running at half load and full load, and leaves one unit always in reserve. It is, of course, desirable for the sake of efficiency and consequent economy of power to run all the working machines as near full load as possible, and to keep "on top" of the efficiency curve, and, with this object in view, some roads have made a division of power into, say, two large units, each equal to one-half the full load and one small one equal to one-quarter load. This permits full load running practically all the time, as combinations of these machines will give one-quarter load, one-half, three-quarter and full load; but in case one of the large units gives out, the remaining one-half and one quarter unit will have to be considerably overloaded to handle the full load of the station.

It is interesting to note how daily records of current output by readings taken every few minutes will show the separation of the day into distinct load periods which will repeat themselves with astonishing accuracy from day to day when the same general conditions obtain.

For this reason, and because it is impossible to keep playing the generator units into combinations to fit all these fluctuations, it is necessary to choose a generator at the outset with a good efficiency curve; in other words, a "flat" curve, one which rises to 90 per cent. or thereabouts at a comparatively small load, and gradually rises with the load to a high maximum, running then on a practically horizontal line, until the load becomes excessive.

As contributing to this result, the machines should run without excessive heating, which means ample capacity in conductors, commutators and armature, large radiating surfaces, good ventilation and sufficient bearings.

They must run free from sparking up to reasonable overloads, and must have insulation of sufficient resistance to prevent leakages to ground, and, after all this, they must be kept clean.

Buyers should also remember that the manufacturing companies whose engineers have made these points a matter of special study, and have the experience of scores of plants to guide them, ought to be, and are, in a position to judge intelligently of the general proportions best calculated to give a certain result.

The buyers should, therefore, confine their specifications, in a reasonable degree, to a list of conditions to be fulfilled—naming the heating, sparking and overload limits required, with other general features, leaving the means for reaching these ends, *i. e.*, the size of conductors, number of commutator bars, thickness of insulation and the thousand and one details of design which go to make up an efficient machine, to the makers.

A great deal would be gained in this direction if consulting engineers fully realized that unless they have given the matter enough study to qualify them as generator designers, they may, through insisting on some peculiarity of detail and receiving a generator fulfilling their specifications, get a machine inferior to what would have been furnished had the manufacturer been held accountable for results only.

As bearing on the general efficiency of the system, the line should be of ample capacity, and of insulation sufficient to withstand the potential at all times. The ground return capacity should, of course, be equal to the overhead feeder. An abundance of overhead copper with bad rail-bonding, with perhaps open circuits, is an absurdity. As affecting the life of the motors, the feeders should be distributed to deliver as nearly as possible an even potential all over the line, and while the voltage should not be allowed to drop too low, it also should not be raised to any considerable degree above the normal point, as this puts the motor insulation under undue stress.

On this account, when cars run directly past the power house, the feeders should not attach directly to the line, but should spread in either direction and feed back to this point.

It is evident that when a motor has become dusty or moistened in service, its insulation resistance is reduced, and any excess in potential above its safe limit will result in punctures of the winding and other leakages to ground; whereas, if the pressure be kept inside this limit, if only by a few volts, the bulk of such trouble may be avoided.

Of course, the motor is another factor of prime importance in the economy of power, and what has been said under generators regarding efficiency will apply in a general way here. A motor should be as light as is consistent with strength and power, and should be compact and protected by its frame.

The most important consideration in the purchase of motors may be safely said to be cost of maintenance, but this has no direct bearing on the economy of power, much as it has to do with economy of operation.

As a power saver, the most important part of the car equipment is the controller. The time has gone by when it was necessary to draw comparisons between rheostatic and series parallel control in considering equipments; yet a good many lines are operating rheostatic controllers without apparently appreciating the loss they are sustaining. Aside from the out and out saving in power by the use of series parallel control, which amounts to a clean 25 to 40 per cent, according to the series, it should be remembered that the necessary generating plant for operating with such controllers is much less than that required for the same car service under rheostatic control, not only because of the average economy of power, but because the momentary fluctuations of load, which must be taken care of, are much less violent, and this latter condition holds good in any case, even for a high-speed road, making few stops, and where the motors are kept in multiple so much of the time that the average power consumed is practically the same for both methods of control.

Another practical advantage is found in the possibility of running all the cars at half speed in case of the disabling of half the power house capacity. This is an important consideration, for instance on a stormy day, perhaps during a snow storm, when the first desire of patrons is to get aboard cars in large numbers, away from the weather and to be carried to their destination. At such a time the number of minutes consumed in getting there is usually a secondary consideration.

Tracing up the subject of operation at the power house, one of the most effective economies is the use of recording wattmeters registering the load continuously.

By this means, and in connection with readings on individual cars load curves may be established, representing fairly (by the division of the day into load periods, as mentioned above, and the current output during those periods) the power which should be consumed to handle a given traffic. In this way a careful and intelligent comparison may be drawn between different days in a season and between days of similar character.

Wattmeter readings on separate cars are of especial importance, establishing, as they do, for the unit what the station readings show for the whole system. Repetitions under all conditions will show whether a certain car should consume 800 or 900 or some other number of watt-hours in running a mile, and any sudden or wide variation to-morrow from the standard load readings of to-day and yesterday will indic te a leakage of some sort and attract prompt attention. Without such a system of checks in the delivery of current, there is nothing but the sluggish coal pile to betray any irregularity in power consumption.

In addition to these guards, a recording voltmeter should be used at the station or a voltage record kept at very frequent intervals. With due allowance for over compounding, the theoretical record would be a circle, and in practice, with a fairly constant load, the record should approach this standard. If the voltage undergo wide fluctuations, comparing different times of the day, the generator is faulty, or the station man is negligent, and in either case the motors suffer, and they not only require a greater average current to do a given work at reduced voltage, but they will consume more watts in doing it.

A very great factor in saving power is the degree of intelligence of the motormen. They are too often put upon cars with scarcely any preparation and are then practically left to their own devices, and naturally handle their cars uneconomically. They will often move the controller handle around the dial without regard to the notches, passing into No. 2 before acceleration of the first position has been felt, and so on to Nos. 3 and 4. It sometimes practically amounts to throwing the handle immediately into the first position. As far as economy of power is concerned, such men might almost as well have rheostatic controllers. The pity of it is, too, that, as a rule, the men are not to blame, never having received proper instructions.

A valuable aid in the education of motormen is the use of an ammeter in the motor circuit, in plain sight, so that during their run the men can see the fluctuations of the instrument and note the results of incorrect handling as compared with the right method.

1. From *Cassier's Magazine* for December.

The plan followed by Mr. Knox, of the Chicago City railway, is certainly an excellent one. He has printed curves, laid upon one plot, comparing the current fluctuations with right and wrong methods of starting, posted around the car barns and employes' rooms as a graphic object lesson, which has resulted in an economy of power.

Further than this, motormen should be instructed in the car circuits, with diagrams showing the connections at each position of the controller. With this knowledge a conscientious man would involuntarily make an effort in the right direction.

Another great coal consumer is the brake. A great amount of power is wasted by men who throw their controllers into contact before thoroughly releasing brakes, even when there is no danger of backing. They also throw on the brake before throwing off the power.

Very few men understand or attempt to use the momentum of their car to advantage. They will run with power on close up to a leading car and then apply brakes, when they might coast many feet, using no current whatever. This momentum may also be used to advantage on curves, switches or wherever there is unusual resistance.

The careful scheduling of cars with respect to grades may be an important economy, and although it is a complicated problem, it is worthy of more attention than it is usually given.

Care should be taken to keep bearings and running gear in good condition and to maintain track gauges. The wheels upon any truck should be made of the same diameter (a precaution frequently overlooked) to permit the motors to wear in perfect unison.

A full consideration of this heading leads into every branch of the operation of electric railways, and although the efficiencies of apparatus and the direct handling of it are the first things to consider, every fault in system or operation is directly or indirectly an attack on the coal pile.

## Telephone News From the Northwest.

[From the Minneapolis correspondent of the WESTERN ELECTRICIAN.]

The Northwestern Telephone Exchange company has completed its long-distance line between La Crosse and St. Paul. There is still a short distance below La Crosse to be built to complete long-distance connection with Chicago and the East. This company is now putting a cable across the Mississippi river at La Crosse. The cable is one inch in diameter and 1,500 feet long. The ice has to be cut through from one side to the other. The cost of the cable is $1,500 and the cost of laying it will be about $200 additional.

The Marquette County Telephone company has 190 instruments in use at Ishpeming, Mich., and 40 at Marquette, and more being added steadily.

The Long-distance Telephone company, which has extensive connections in northern Iowa and southern Minnesota, hopes to make arrangements with the company owning the line from Waterville, Minn., to the Twin Cities, by which the use of their poles may be secured and a line strung to Minneapolis and St. Paul at once.

The Western Electric Telephone company is completing a 40-instrument exchange at Algona, Ia.

W. C. Swift is replacing the old telephone exchange at Grand Rapids, Minn., which never worked satisfactorily, with a new switchboard and new wires.

The Northwestern Telephone Exchange company will rebuild its line from Winona, Minn., to Rollingstone, and put in a metallic circuit.

The City Council of Valley City, N. D., has granted the Northwestern Telephone Exchange company a franchise to operate a telephone exchange.

The suit of Mrs. Sarah Lewis against the Home Telephone company of Sioux City, Ia., for damages for personal injuries sustained by falling head first into a telephone post hole which was not covered, and remaining there for an hour, has been dismissed, the company paying $800 damages.

Assistant Superintendent Fisk, of the Central Union Telephone company, says that operations will begin on the long-distance line between Chicago and Davenport., Ia., as early in the spring as conditions will permit.

Twelve linemen of the Dane County Telephone company of Madison, Wis., struck, demanding shorter hours and better pay. The company promptly discharged them. The company claims the strike was brought about by the Wisconsin Telephone company, for which the men immediately went to work. The Wisconsin company says that it was in no way responsible for the strike, but needed men and hired them when they applied for work.

The Bigelow Lumber company is testing some of the Standard telephones, and if they prove satisfactory will put in six sets for their logging road in Bayfield county, Wis.

## A Ridiculous Pamphlet.

The Indiana Avenue Property Owners' association of Chicago, organized to fight the trolley, has issued a pamphlet of 40 pages containing newspaper accounts of 187 fatalities and 373 serious bodily injuries caused by trolleys in the United States within a recent period. The text of the pamphlet is classified under seven heads—"Death Roll in Chicago," "Slaughter of the Innocents," "Bloody Record in Brooklyn," "Work of Broken Wires," "Increased Fire Risks," "Other Methods Much Better," and "No Legal Right in Chicago." Under the last head are quotations to show that the overhead trolley has no right to exist anywhere.

## The Electric Wiring Question.[1]

BY FRED. BATHURST.

The author commences his paper with an outline of the electrical progress of England as compared with that of America. Both countries were, he says, in 1881 on the same basis; the apparatus was crude, experimental and imperfect, and the knowledge in respect to the safe and proper handling of the apparatus employed was limited, and possessed by but few people. In England in 1883 the possible dangers began to attract attention, and rules and regulations were issued which were to control development and progress. In America no regulations were enforced. In 1887 America had in operation (not to mention innumerable isolated plants) some 70 central stations, supplying over a quarter of a million incandescent lamps. In England at that time there was one central station, supplying about 5,000 lamps, and a proportionate number of independent plants. On the fire question the author quotes the reports issued by the Underwriters' Electrical Bureau. Taking 1893–1894 as two typical years in which public alarm was prevalent in America, reference to the records shows the occurrence yearly of between 400 and 500 fires traced to electrical causes. Some 320 involve no monetary loss, but the remainder (100 to 200) resulted in a loss of £300,000 per year. This sum, though apparently large in itself, is less than 1 per cent. of the total fire loss of some £35,000,000 from all causes. The bulk of the electrical loss occurs in the Western states, and for the more populous Eastern towns the proportionate loss is less than ½ per cent. The loss arising from the use of kerosene oil and matches is appalling in comparison, and the figures are best not quoted. Taking the figures from the United States government records, the average monetary loss per year, for nine years ending 1893, that "lightning" involved amounted to £310,000, or some £10,000 per year more than that caused by the commercial use of electricity. The author, therefore, argues that restrictions of one sort or another have hampered the proper development of the English electrical industry.

The principal obstacle to the general use of electrical applications is that under our present wiring rules it is impossible to place the cost of installation within reach of the great bulk of our people. What is still required is the introduction of rules and regulations which will facilitate the growth of "lower cost wiring." Nothing is further from the author's intention than to advocate cheap, defective, poor, or dangerous wiring. With "lower cost" wiring we could, for instance, successfully compete with the lately introduced "incandescent gas burner," which, priced at about 13s., has had a sale amounting to three-quarters of a million. It is being recognized that the ruling factor which governs public demand is small initial outlay. Even the gas companies are facing the question of fitting consumers' premises free and reimbursing themselves by charging a slightly increased price for the gas supplied.

The five cardinal points of good wiring may be given as safety, durability, convenience, accessibility and economy. Prof. S. P. Thompson, in a lecture on the subject before the Society of Arts, has embodied the essential features in a few words when he said: "What is wanted is a mode of running wires and fixing switches and other accessories, so that they shall not only be electric tight, but shall also be water-tight, gas-tight, air-tight, oil-tight, fire-tight and even rat-tight." It is the author's belief that all these requirements can be met by the use of fire-proof insulating tubes.

It will probably be admitted that wood casing fails in many respects. The idea of its use originated with the telegraphic engineer, and 15 years ago electricians were contented with it. Even on the surface it is neither picturesque nor decorative. It is easy to install, but its nature prevents any very correct or exact estimate being formed of the labor required. If surface work is required on the score of economy, surely it would be better to adopt "open work" on porcelain insulators—a safe and scientific method of wiring, which can be carried out at a very much lower price. We know this system is discouraged; but it is noteworthy that in the only prominent installation in this country where "open work" has been used, the single source of trouble which occurred arose on a circuit in a damp cellar, where, in order to conform with the fire office "requirements," wood casing had been employed. Someone may argue that this could not have occurred if the circuits had been "tested" as the "rules" recommend. Our "insulation test" never yet told far into the future, and it only tells the present to a limited extent. "Insulation test" cannot discover an unsoldered joint or a dangerous diminution in respect to current-carrying capacity. Every practical man will agree that insulation testing will not necessarily indicate that the wires are at places in dangerous proximity to gas or water systems in the event of moisture appearing.

The recognized shortcoming of wood has brought into use iron and "lead compo" piping. Lead compo pipes afford but little mechanical protection in emergency, and, with respect to "accessibility," have serious drawbacks on account of their flexibility. A large amount of "surface leakage" necessarily arises from the use of any ordinary metal tubing. Moreover, if the insulating material on the conductors has from any reason deteriorated and moisture appears, there will be consequent injury both to conductor and tube. Cases have occurred where the protecting fuses on a circuit did not "blow" before electrolysis promoted a dangerous arc which had burnt a hole in the tube and presented a serious fire risk. If a defect occurs anywhere in the insulation of a wire which is within a metal pipe so that there is electrical contact between the conductor and the pipe, the effect of the fault is virtually transmitted throughout the whole length of piping, there to await or invite trouble elsewhere. With two conductors in the pipe a new and unanticipated electrical condition prevails, because one conductor is now of greater carrying capacity than the other, which has been increased by the capacity of the tube itself. Overheating of the intact conductor can now invite serious trouble at any point. This, the author thinks, explains why overloaded wires in pipes have occasionally "burnt out" at several points at the same instant. It must not be forgotten, also, that failure of insulation on one wire means that the voltage tending to break down the other is doubled, and the actual strain ($C^2R$) increased fourfold. Perhaps at this point it will be noticed that these criticisms show, incidentally, how much more the immunity from electrical fires has depended upon the honor and integrity of the contractors than upon the "rules" provided for their guidance. Iron pipes have the disadvantages common to all metal pipes, and, as we know, may rust inside, and this rust is not a condition favorable to "insulation;" they often have burrs or other internal roughnesses which may cause serious mechanical damage to the insulating material as the wires are being drawn in. If iron pipes are screwed at the end for the purpose of jointing, oil is probably employed, and any excessive presence inside is not helpful to a rubber insulation. Cases are on record where this oil has caused extensive mischief. Early in the art of wiring it was recognized that gas brackets, when modified so as to serve as "electrics," should be insulated from the remainder of the gas piping; but now that we are using electric wires themselves in metallic pipes, we appear to overlook the possibility of the electric system being elsewhere in hazardous contact with conjointly installed steam or water systems. It is now apparent that metal pipes, if not actually harmful, are certainly not particularly helpful to the maintenance of insulation resistance.

It may be thought that we must turn away from tube or pipe methods altogether in order to find economic wiring. Experience in other countries, however, does not show that any "rigid" system of conductors is making progress or headway. No insulated wire has yet been produced which in itself can successfully resist the deteriorating influences present in mortar or plaster. Even lead-covered insulating wires, if directly embedded in plaster, have been found wanting, and give trouble from "earths" and "short-circuits" as soon as moisture has made an appearance. With any rigid method, if walls happen to crack and settle, or plasterers and bricklayers cause damage, a fault may develop which is very difficult to find. Usually, also, they are handicapped commercially in respect to making joints and connections, as these involve risk and trouble even with the highest quality workmen. A cardinal objection to "rigid" methods is the lack of accessibility. All good wiring should be accessible, for with this quality assured half the difficulty of "trouble" is already fought, and any imperfection or injury, whether arising from poor work, negligence or accident, can be remedied with a minimum of inconvenience. A conduit or race-way is the practical way of rendering wires "accessible," for then the wires installed in them are always open to the inspection of owner or wireman, whenever he wishes to satisfy himself as to their condition or to effect a renewal. "Accessibility" ought, therefore, to be a fire office requirement; with it an inspector can use his eyes and have no need to trust to his ears for inspection. From the contractor's point of view "accessibility" is desirable as limiting unfair and injurious competition; for, when an installation can be readily inspected, inferior materials cannot be used for the purpose of cutting down prices, workmanship cannot be scamped, and the "death knell" of unprincipled competition could be sounded for all time.

From a labor-saving point of view a flexible conduit would apparently commend itself. While cases do occur where this is true, every flexible conduit has the inherent drawback, as shown by experience, that the property of "flexibility" may so far assert itself that numberless bends will prevent the wires from being drawn out. Any trouble which then occurs will have to be cut out, or else the circuit must be abandoned or wired anew. Flexible conduits are always at a disadvantage, either in respect to moisture-resisting properties, or are wanting in mechanical strength. Bends and elbows must be rigid, or it is impossible to draw the wires in or out; and for the generality of work it will be found that a conduit construction permanently rigid throughout is preferable.

More than half of the cost of the wire used is referable to "insulation," and it is "insulation" we strive to keep. It would, therefore, appear obvious that the conduit should be an "insulating" one. An ideal insulating tube should not only be mechanically strong, but also fire-proof and water-proof. With a tube complying with these requirements all possible electrical trouble is minimized, the insulation on the conductors themselves protected from mechanical damage, and is enveloped in a preservative, rather than a destructive, element. Temperature changes are reduced to a minimum, and if the conduit resists acids, alkalies and gases, the insulating material on the wire is so shielded that its life is indefinitely prolonged. The author contends, therefore, that an insulating tube method of wiring will prove the ultimate solution of the "electric wiring question."

The author then proceeds to describe the method of wiring originated by E. H. Johnson. The insulating material employed is a specially prepared hydrocarbon of the bitumen class. The necessary strength in tube form is obtained by using a peculiar grade of fire-proof paper material which admits of impregnation. The system proivides, the author says, perfect immunity from fire, durability of insulation, accessibility to concealed wires and reliable service. It has had extensive practical test in America, and more recently in Germany, where its reputation for being the safest, least expensive and most practical method of wiring is now established. Already in various countries some two million incandescent lamps are installed in the three varieties of tube—"plain," "brass-coyered" and "iron-armored."

It has been noted that when deterioration takes place in a plain metal tube, the tube itself becomes a conductor, and invites deterioration at many points. If insulated tubes are used (with two conductors inside), the deterioration on one only brings additional stress upon the other conductor at one point. The tendency in this case is to create a "short-

1. Abstract of a paper read before the Institution of Electrical Engineers at London, Eng., November 28, 1895.

circuit" at the spot affected. In these particular tubes a "short-circuit" presents no danger, as the materials of which they are composed will resist the burning effect of the arc. Many tests have been made, and in every case it has been found that the "arc" increased in length until it broke, and severed the circuit without further danger. Any "short-circuit" trouble, then, removes itself, and its injurious effects are confined entirely within the tube. Since the presence of moisture is the principal cause of "short-circuit," the use of these tubes is likely to minimize the occurrence of trouble, because the tube material is non-conducting in respect to heat, and extraneous changes of temperature fail to produce internal condensation. The use of insulating tubes will also remove the increased danger in respect of wires employed for heating or power applications, which may be temporarily overloaded, and in respect of wires protected by a fuse which through careless replacement has been made too large. It may also be that insulating tube methods of wiring will render it possible to materially modify our present practice in respect to "fusing." There is only one point not yet entirely settled. It is whether the two insulated conductors should be kept together or separated—whether one or two tubes should be employed. Owing to the real necessity with a wood-casing system of keeping the wires apart, some authorities urge that this construction should be applied to tube methods, and that a separate tube should be used for each wire. In alternating current circuits it is essential to keep the wires close together, to prevent a drop in voltage from inductional effects. Clearly, therefore, in this case both wires should by preference be in the same tube. In England two conductors are already allowed in "compo" pipes. Theory, in the author's opinion, points to the advisability of placing both wires together, and so far, the results of practice favor this view.

As far as present experience has gone it shows that the bitumenized tube will, under ordinary conditions, last indefinitely. It can safely be embedded in the lime and sand plaster used in ordinary building construction. The present tendency toward fireproof building construction is bringing into use certain cements, caustic enough to attack nearly any material coming into contact with them. The problem thus presented has been successfully solved by the introduction of the "brass-covered" insulating tube. The bituminous material used in these insulating tubes is inert in its nature and exercises no deleterious influence on the insulating material of the wires themselves. It has sufficient mechanical strength to resist any damage except that inflicted by gross carelessness or design, and in the case of chance mechanical injury to the tube the "accessibility" it provides renders repair easy. In respect of permanence and durability the advantage of placing the conducting wires in channels which predetermine their relation to any contiguous conducting bodies is, the author thinks, beyond question. The mischief done to wood casing and "compo" pipe by rats and other vermin is, in the case of these tubes, entirely obviated. From the fact that such inroads are successfully resisted it would appear that bitumen disagrees with a rat's digestive machinery.

An insulating tube system is also economical. With trained workmen it is estimated that a saving from 25 per cent. to 50 per cent. in the labor of installation is made. Even though the tube in itself is comparatively expensive, if wires suitable to it are employed, the total cost of material will compare favorably with any other system. The insulating properties of these tubes is such as to provide (approximately) an additional "300 megohms per mile" insulation resistance to the wire. We are beginning to appreciate the fact that, although we provide a costly "600 megohm wire," after having installed a few hundred feet our tests indicate a total insulation resistance of only a few thousand ohms. An insulating tube system can assist us to obtain a more commensurable result. If a high insulation test has to be obtained in wiring work, practical experience shows there is little doubt that an insulating tube, and its suitably insulated wire inside, is commercially ahead of a relatively heavily insulated wire. Perhaps the limit of economy will be reached when we know how to "earth" perfectly and can use a bare copper conductor within a metal-covered insulating tube.

The author concludes by asking the institution, in considering "the question of electric wiring," in any rules it may issue, to give recognition to, and make due provision for, the use of insulating tubes.

TABLE

*showing the "insulation test" required in the various countries (compiled from rules of supply companies and fire offices), voltage of circuits not to exceed 250 volts.*

| Size of installation wired complete. | Country. England (London). | America (New York). | Germany (Cologne). | Austria (Vienna). |
|---|---|---|---|---|
| Amperes. | Ohms | Ohms. | Ohms. | Ohms. |
| 10 | 500,000 | 2,000,000 | 100,000 | 50,000 |
| 25 | 250,000 | 1,800,000 | 40,000 | 20,000 |
| 50 | 125,000 | 400,000 | 20,000 | 10,000 |

Rev. Mr. Call secured a verdict against the Western Union Telegraph company for $50 at Grand Island, Neb., for mental anguish suffered by the failure of the company to deliver a message announcing the death of his mother. There is considerable complaint about the service of the company in that place and public interest was aroused over the matter. Mr. Call sued for $1,995.

## Attitude of the Illinois Central Toward Electric Power.

So many conflicting statements have appeared in relation to the position assumed by the Illinois Central Railroad company on the question of substituting electric power for steam service for suburban trains, that the following verbatim interview in the *Railway Review* with Chief Engineer J. F. Wallace possesses much interest.

In 1891–92 I made an extensive examination into the advisability of adopting electric power for the fast World's Fair trains, and with a view to adopting the electric system, if any should be established, for the movement of suburban trains after the exposition. The result of this investigation was that I reported to my superior officers against the adoption of electricity as motive power. The question has not been officially considered by the officers of this company since 1892, although the progress of electrical invention has been carefully watched and I have personally on my own responsibility, as a matter of engineering interest, been following the advances made toward electric traction for heavy suburban railway service. I have frequently said I had no doubt that some time in the near future the Illinois Central would take up and consider this question and that conditions were gradually shaping themselves which would make this application possible; not, however, any from preconceived plans for the adoption of electric motive power, but from the fact that the requirements of the service made the conditions more favorable for taking this step.

I do not think the overhead trolley system will give satisfaction, neither do I consider the third rail system feasible on account of the large number of trackmen working on the terminal and the numerous trespassers crossing and re-crossing the tracks. The application of electricity to a service like that of the Illinois Central will necessarily be gradual and slow, and any system that may be adopted should be such as would permit of the common use of the tracks by steam power as well. In other words, the question of the application of electricity on this road is still in the air; and while current events indicate that the application will be made in the near future, it may be two, three or five years before the question is even seriously considered.

Inside of certain limits electricity seems to be the preferable motive power for moving small transportation units, at frequent intervals and for short distances; while on the other hand steam is the most economical and preferable for handling large units of transportation at infrequent intervals and over long distances. The line of demarcation between these extremes is of course rapidly changing, and the field for the adoption of electric power is gradually increasing as the appliances therefor are more thoroughly perfected and the problems of economical constructions, maintenance and operation are solved.

## Management of the Western Union.

A New York newspaper correspondent says that George Gould is devoted to business these days, and in his modest office in Broadway, near St. Paul's church, controls the operation of the Western Union Telegraph company, whose property amounts in value to over $100,000,000. The Western Union company is one of the largest corporations in the world. Some financiers think that the operations which led to the consolidation of nearly all of the telegraph corporations in the United States into one gigantic institution are in many respects the finest exemplifications of business skill this generation has seen, and as it is likely that in the history of the world no such colossal and intricate financiering has occurred as some of the achievements of the last half of the present century, it is fair to assume that this organization stands unrivaled in the history of financiering, unless one were to except, perhaps, the Standard Oil combination and one or two railroad consolidations.

The acting manager of the Western Union, General Eckert, is one of those men who are great enough to be modest. On Broadway or Wall street the eye of a stranger might be fixed upon him for a moment as a man who had learned the art of dressing well without being conspicuous, and one of those who was able to pass through the hustling throng that gathers in the money center at midday without displaying any of that haste or rush or anxiety which characterizes Wall street. If this stranger should happen to meet him and enter into conversation with him he would find a man of gentle manners, quiet speech and unobtrusive personality and would be likely to be amazed if told that this man carries the colossal part of the Western Union company in his head, so to speak, and had made of it so perfect a machine that it obeyed his will as easily as a Morse instrument responds to the touch of an operator's key.

General Eckert is of Ohio birth, and he was just old enough at the time when Morse gave his instrument to the world to be one of the first who mastered it. He not only mastered it, but he loved it, and he was soon recognized as one of the ablest operators in the West. That meant promotion, of course. He was put in charge of an office, and afterward became the general superintendent of the company which operated the telegraph along the line of that railroad which is now called the Pan Handle, running from Pittsburg to Cincinnati. In 1859 he made the acquaintance of Anson Stager and J. B. Layng, all three of them afterward to become famous and influential. Mr. Layng was the general manager of this railroad and Stager was an expert electrician. They were young men and they had their careers to make, and made them conspicuously afterward. When the war broke out Eckert became an associate of Charles A. Dana in the War Department, where he organized and had charge of the important telegraphic service of the army, and perhaps it was here that his extraordinary executive capacity first attracted the greater capitalists of the East.

# CORRESPONDENCE.

## New York Notes.

NEW YORK, December 14.—At this week's meeting of the Rapid Transit Commissioners the board devoted itself principally to the consideration of proposed changes in the location of express and local stations on the proposed lines. No definite action was taken.

The property of the Long Island Traction company was sold at public auction yesterday for $5,500,000. Only one bid was made. The property was knocked down to John G. Jenkins, president of the First National Bank of Brooklyn. Mr. Jenkins is understood to have acted in the interests of the reorganization committee. He presented a certified check for $10,000 before making the bid. To add to the confused street railway situation in Brooklyn comes the announcement from Albany that a new corporation—the Brooklyn Bridge, Prospect Park & Eastern Railroad company—has been incorporated, to construct and operate a street surface railway in Brooklyn, about 40 miles long. The capital is to be $500,000, divided into 5,000 shares; the principal offices are in Brooklyn, and the directors are A. N. Brady of Albany; Frederick S. Flower, Edward Browne, Ira A. Place, William J. K. Kenney, Charles H. Warner, George M. Curtis, Jr., and Walter H. Curtis of New York city, and John R. Petitt of Brooklyn. Commenting on the organization of the new company, the *Tribune* says:

Mr. Brady is a member of the reorganization committee of the Long Island Traction company. Mr. Flower is a nephew of ex-Governor Flower, of that committee, and these facts lead to the belief that the interests of that company and the new one are largely identical, and that the Brooklyn Bridge, Prospect Park & Eastern Railroad company may be controlled by the Long Island Traction company for the purpose of securing extension of routes and fighting P. H. Flynn and his syndicate. Moreover, "Blue-eyed Billy" Sheehan belongs to the law firm of Collins & Sheehan (Mr. Flower's private counsel) and is the counsel for the new company, and the routes proposed by it are practically identical with those asked for by the Flynn company, although there are expedient variations. Indications point to a fact which the *Tribune* published some time ago: That the Flynn syndicate and the Brooklyn Heights people are using every endeavor to kill each other, the fight being opened by the aggressive Mr. Flynn, and the Brooklyn Heights company scorning to make concessions, and retaliating in kind. It is rather difficult to get at the exact truth amid the kaleidoscopic applications for franchises recently made, and the officers of the companies are shrewdly non-communicative. Meanwhile Brooklyn property owners and those citizens opposed to the trolley have something new to think over every day. With so many comprehensive applications pending, and with nobody knows how many more coming, with the old Board of Aldermen still pondering, and a new board waiting to take its place, things are "slightly mixed."

President Rossiter of the Brooklyn Heights company says that his company is endeavoring to comply with the speed requirements of the municipal authorities, and is fitting cars with fenders at the rate of 15 a day.

The Western Union report for the last quarter of the year was issued on Wednesday. These figures are taken from it:

| | | |
|---|---|---|
| Surplus October 1st | | $7,854,622 99 |
| The net revenues of the quarter ending December 31st, instant, based upon nearly completed returns for October, partial returns for November, and estimating the business for December, will be about | | 1,700,000 00 |
| | | $9,554,622 99 |
| From which appropriating for— | | |
| Interest on bonds | $223,550 00 | |
| Sinking funds | 20,000 00 | |
| | | 243,550 00 |
| | | $9,311,072 99 |
| It requires for a dividend of 1¼ per cent. on capital stock issued about | | 1,191,945 00 |
| Deducting which leaves a surplus, after paying dividend, of | | $8,119,127 99 |

There has been some delay in the completion of the cars which are to be used on the new trolley postal routes in Brooklyn, and hence it was impossible to get the new service in operation at the beginning of December, as it was expected. No date has yet been set, but it is now believed by Postmaster Sullivan that the cars will be in operation next week, though it is possible that some further delays will occur. The cars, of which there are to be five, are being built in Philadelphia, and those which are completed were inspected recently by postoffice officials and found to be satisfactory. W. F. O.

## Washington, D. C.

WASHINGTON, December 13.—B. H. Ridgely, United States consul, in a recent report to the Department of State dated Geneva, November 19, 1895, calls attention to the approaching Swiss National Exhibition, which will be inaugurated at Geneva on the first day of May, 1896. Special prominence will be given to electrical appli-

ances. All the principal manufacturers in Switzerland have taken space, and are sparing neither pains nor expense to make the general display worthy of the country. In the electrical department some of the exhibitors have already taken space, but have not declared the full nature of their exhibits. There will be a traveling foot-path operated by electricity which will traverse the whole length of the great machinery hall. A force equal to 12,000 horse power is at the disposal of the exhibition authorities. This power is derived from the river Rhone. Duplicates of the turbines and other water power motors of the Rhone, the inventions of Theodore Turrettini, who is the mayor of Geneva, will have an important place. Electric carriages, a multiplying valve pump, and appliances for aerial navigation, will be shown, together with all processes (with the machines at work) employed in the production of paper, silk, cotton goods, etc., with electricity as the motive power. Methods of applying electricity for testing strength and qualities of all metals and materials will be shown by one of the principal Swiss scientists. Swiss residents of the United States are competent to exhibit, and the president, Theodore Turrettini, is anxious that they should be represented. President Turrettini is one of the most distinguished of European engineers and inventors, and he is taking great personal interest in the exposition.

John R. Galloway, the dealer in electrical supplies at 529 Tenth street, has the contract for wiring the Columbia Athletic club. Mr. Galloway has also recently presented to the St. Vincent's Orphans' Fair incandescent and miniature lamps and the necessary wiring.

A temporary injunction and a rule to show cause, returnable December 20, 1895, why the commissioners should issue to the Potomac Light & Power company a permit for the laying of a conduit on M street or any other street, were ordered this week by Chief Justice Bingham. The order was the result of a bill for such an injunction brought by the United States Electric Lighting company against the District and the Potomac company. Several days ago the commissioners ordered this permit issued. The Electric Lighting company claims prior rights in the matter, which, it is claimed, would be interfered with were such a permit issued and work allowed to be done. The company alleges that such a granting would be illegal. It is desired that the Potomac Light & Power company be temporarily enjoined from applying for or receiving a permit for a conduit on M street or any other street. The United States company wants the commissioners to disclose what permits they have issued, and if any, what work has been done, and by what authority they have acted. Information is asked as to whether the commissioners were advised in the matter by the attorney for the District. The United States Electric Lighting company claims that by permission of certain acts of Congress, set forth in the bill they have filed, that it is the only company authorized to lay conduits in the district.

The Metropolitan Railway company, through its attorney, E. P. Fish, has filed answer to the complaint made by Elias E. Ries and Robert H. Henderson, in the suit filed for infringement of a patent in the use of certain underground devices and improvements in its underground electric system. The company asserts that the alleged patents claimed by Ries and Henderson were of no effect, and that the devices designated were in use for more than two years prior to the several dates claimed for the application for the letters patent set up by the complainants.

The Potomac Electric Lighting company has secured a contract to light the streets of Cleveland Park with 24 or 25 candle power incandescent lamps. It is preparing to put some fine machinery in the old Dent foundry, Georgetown, and in a short time will have an extensive electric lighting plant. The machinery from the old Eckington power house will be transferred to Georgetown, the company having purchased it, and the current for Eckington will be furnished from Georgetown.

Senator Gallinger has introduced a resolution concerning the system of overhead wires. The resolution relates that by act of July, 1888, the commissioners were authorized to permit no additional telegraph, telephone or electric lighting or any other wires to be erected over any of the streets or avenues of the city of Washington, and by act of March 2, 1895, directed them, not later than the expiration of the Fifty-first Congress, to authorize such existing overhead wires to be placed underground. It also relates that a number of companies having overhead wires removed them and placed them underground; that the report of the electric commission, appointed October, 1891, was still unacted on by Congress. It further relates that the commissioners have been granted the right to permit existing companies to extend their lines, and that the evident intention of Congress is to prevent the further erection of overhead wires in the District, and placing all electric wires underground. It therefore calls on the commissioners to report to the Senate the permits that have been issued for overhead wires since September 15, 1888, to whom granted and under what authority. Also whether under the act of 1891 permits have been granted for placing any conduits or subways for electric wire which were not an addition to or extension of a previously existing law. If so, the name of the persons or corporations, and what work has been done by them. The resolution further provides that, pending the report called for, the District commissioners are requested to issue no further permits for the erection of any overhead wires in the District, and if such permits have been issued, to remove them. Also that no further electric conduits or subways in the District shall be built pending action by Congress.

Some enterprising Americans have made application in the city of Honolulu for permission to build a trolley road, and F. S. Dodge, the city engineer, called at the District building recently to look into the street railway franchises of this country. T. M.

## PERSONAL.

S. B. Condit, Jr., manager for L. A. Chase & Co. of Boston, was in Chicago on Monday.

John Kruesi, mechanical engineer, and W. L. R. Emmett, engineer of the lighting department of the General Electric company, Schenectady, paid a visit to Chicago last week.

The board of trustees of the University of Illinois has made two important promotions. William Esty has been raised from the position of instructor in electrical engineering to that of assistant professor, and Mr. Sager, who has been instructor in physics for the last year, was made assistant professor in that department.

Mrs. Emeline Westinghouse, widow of the late George Westinghouse, Sr., died in New York recently at the age of 86 years. In 1828 she was married to George Westinghouse, Sr., an inventor, who afterward became the proprietor of the Schenectady Agricultural Works, at Schenectady, N. Y., and who died on December 30, 1884, when 75 years old. She was the mother of 10 children, of whom only two survive—George Westinghouse, Jr., inventor of the Westinghouse air brake and president of the Westinghouse Air Brake company and the Westinghouse Electric & Manufacturing company, and Herman H. Westinghouse, inventor of the Westinghouse engine and general manager of the Westinghouse Air Brake company. Mrs. Westinghouse was of pronounced character, but of kindly and benevolent disposition and greatly beloved.

## ELECTRIC LIGHTING.

The town of Camden, Maine, after being in darkness for 18 months, was again brilliantly illuminated on the 9th of December, much to the delight of the citizens, the ladies being especially jubilant. Manager Hawken, of the Knox Gas & Electric company, has rebuilt the whole pole line and put in 23 Brush double arc lamps.

## ELECTRIC RAILWAYS.

A mortgage was filed in the recorder's office at Chicago on December 11th by which the North Side Electric Street Railway company secured a loan of $1,500,000 from the Illinois Trust and Savings Bank. It is said the money was borrowed to complete its plant as proposed by the board of directors.

Judge Baker of Indianapolis has closed up the papers by which the sale is effected of the South Bend and Mishawaka electric railroad to George E. Clifford, president of the Wachusett National Bank of Richfield, Mass. The price paid was $50,000. It is the intention of Mr. Clifford to put the road in fine order.

A Baltimore paper reports that electric locomotive No. 2 of the Baltimore & Ohio tunnel line has successfully withstood severe tests. The new engine hauled 28 loaded cars, two "dead" engines and a caboose, a total weight of about 1,400 tons, through the tunnel at the rate of about 23 miles an hour. The train entered the tunnel at a speed of 20 miles an hour. A stop was made in the tunnel, and with all drawbars stretched the start was again made without a slip of the wheel. In doing this and accelearting the train up to the speed of 23 miles an hour a draw-bar pull of 58,630 pounds was exerted. With this tremendous strain the engineers say the least jerk would have snapped a coupling-pin and broken the train apart. From one of the locomotives on the rear end of the train, where a jerky motion would be felt the greatest, an entire absence of such a jar was noted. During the work an imput of 4,100 amperes at a pressure of 600 volts was measured. The test is regarded as the severest yet attempted by such a locomotive. No. 3, which will complete the number of locomotives for the Belt Line service, is now approaching completion at Schenectady and will be brought to Baltimore about January 1st.

## MISCELLANEOUS.

In relation to the affairs of the Lodge & Davis Machine Tool company, a Cincinnati newspaper states that the motion for a confirmation of the referee's report and a sale of the assets is before Judge Moore. Thos. McDougall, for the company, filed a motion to strike from the files the motion to confirm for a receiver and a sale of the assets.

## TRADE NEWS.

One of the largest dealers in telegraph and street railway poles is A. Bushnell of Kansas City, Mo. Since July last he has sold over 1,500 cypress poles to street railway and electric light companies, and is constantly rushed with orders for cypress piling of unusual lengths, which he is able to supply on short notice. Mr. Bushnell has done a flourishing business ever since he commenced in 1886.

Thos. G. Oakes, who for many years has been manager of the sales department of the Jenkins Valve company of New York, has resigned his position to accept a flattering offer from the Mason Regulator company of Boston, Mass., to take charge of its office, located at 52 John street, New York, where he will handle a line of Mason steam pumps, damper regulators, pump receivers and steam traps. Mr. Oakes has an extensive and valuable acquaintance in the electrical trade, and his friends will be glad to hear of his success.

The Gates Electric Manufacturing company of Chicago has recently installed a 75 horse power, 500 revolution motor in the works of Fraser & Chalmers, Chicago, for the operation of a large Root blower at the cupola. John Walker, manager of Fraser & Chalmers, in a recent letter to a large concern contemplating the installation of a similar outfit, stated that they had received a machine with more capacity and efficiency than contracted for. He said that this motor, both as to construction and electrical requirements, is the best that his company knows of. The Gates company also reports an active trade in electrical apparatus for mines, street railways and lighting plants.

At the annual meeting of the board of directors of the Phœnix Carbon Manufacturing company of St. Louis, held on December 10th, it was unanimously decided, in view of the increase of business and the flattering outlook in all of the various departments, to increase the capital stock to $250,000. The Phœnix company is incorporated under the laws of Missouri for $100,000, fully paid up, and as there is a stringent anti-trust law in that state, it will be seen that the increase of $150,000 in capital stock means a good, straightforward and growing business. This is, incidentally, a high tribute to the ability of Superintendent S. G. Booker, whose energy and keen business judgment have been unremittingly exercised for the benefit of the company. The growth of the business has been exceptional, and as the increase of capitalization will be paid in at once and used for the extension and enlargement of the present plant, it will be seen that the facilities of the company will be made adequate to the growing demand tor Phœnix carbons. The Phœnix company is certainly entitled to congratulations.

## BUSINESS.

The Mica Insulator company of New York has purchased the entire business of the Empire Electric Insulation company of Schenectady, N. Y., manufacturer of oil insulating cloth and paper, and will continue the business in connection with the manufacture of micanite specialties.

A very creditable catalogue of electric light supplies is issued by the E. P. Gleason Manufacturing company of 181–189 Mercer street, New York. The book has 210 pages and flexible covers, and is completely illustrated and well printed. It is particularly complete in glass goods and fixtures, but covers all lighting supplies and will be a valuable aid to the buyer.

The improved Hunnings telephone and telephone switchboard, manufactured by the Electric Appliance company, continues to hold its ground as one of the most satisfactory outfits on the market. The telephone itself has been improved from time to time until it is now said to be a perfect instrument. The switchboard is a winner, and is operated more easily and with a less number of movements, it is claimed, than the regular Bell board.

President H. G. Ferguson of the International Electric company, St. Louis, visited Chicago last week in the interest of his company. The International Electric company is at present actively engaged in pushing the Davey high grade incandescent lamp, and Mr. Ferguson states that the prospects are most encouraging. It is not unlikely that the International company will establish a branch of its business in Chicago. Mr. Ferguson is an old electric light man, and is thoroughly familiar with the electrical business, having been in it for a number of years, and Mr. Davey, after whom the lamp is named, is well known among lamp manufacturers. With two such energetic men, each pushing his respective department, it is only reasonable to presume that the new company will rapidly bring its product into the foremost rank.

In November, 1894, the Ætna, Ind., Powder company decided to install two small slow-speed generators for operating incandescent lamps on the Edison three-wire system and placed the order with the General Electric company. As these could not be delivered immediately, two second-hand machines were installed temporarily, and before the first two new ones ordered could be delivered, the order was changed to two larger, moderate-speed generators, with the privilege of changing them for two still larger ones. In June, 1895, the last two were ordered, together with two motors, one of one horse power, the other of five horse power. On August 2d the Ætna company ordered another motor of five horse power, and on August 14th still another of the same capacity. The company having enlarged its plant during the summer found its electrical installation insufficient, and on October 12th ordered two 45 kilowatt moderate-speed generators and two moderate-speed motors, one of 20 horse power, the other of 30 horse power. Thus within one year electricity had given the Powder company such satisfaction that it now has 66 horse power in motors and 93 incandescent lamps taking current from the two 45 kilowatt generators. The one horse power and the five horse power motors are used to drive small mixing machines in the manufacture of dynamite. The 30 horse power motor operates a large machine used for pulverizing nitrate of soda, and the 20 horse power runs a number of machines, such as the dry pan and mixing machines. The Powder company found that the first five horse power motor, which it substituted for a steam engine, readily performed a duty which the engine found difficult.

# ILLUSTRATED ELECTRICAL PATENT RECORD.

*Issued December 10, 1895.*

550,950. Paper Registering Machine. Talbot C. Dexter, Pearl River, N. Y. Application filed October 26, 1894.

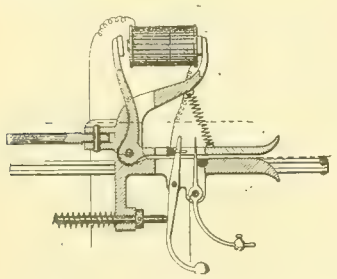
The cut shows a reciprocating gripper, having its jaws held normally in an open position, an electro-magnet closing these jaws by the attraction of its armature a normally open electric circuit and a circuit closer in the path of the paper to be actuated thereby.

550,956. Carbon Holder for Arc Lamps. Hugh J. Farley, Philadelphia, Pa. Application filed December 15, 1894.

A removable casing is formed in separable sections, the body portion having an interior flange threaded to receive the outer casing, which is formed in two parts with a spherical cavity to receive the rod of the lamp, and a ring nut having a series of spring fingers adapted to be secured to the lower end of the body of the holder.

550,959. Electric Clock. Benjamin Franklin, Chicago, Ill. Application filed April 1, 1893.

The impulse-producing mechanism is arranged to be set by electrical action.



NO. 550,950.

550,965. Electrical Conduit Railway. John D. Griffen, New York, N. Y. Application filed December 5, 1892.

The conduit has the usual slot, the trolley wire and the trolley arm, a carriage for the trolley arm with rollers adapted to engage the sides of the slot. There are also ball boxes in which the rollers are journaled, and which are provided with hubs and springs engaging the hubs and acting to hold the rollers in contact with the sides of the slot with a yielding pressure.

551,014. Electric Smelting Furnace. Joseph A. Vincent, Philadelphia, Pa. Application filed July 18, 1895.

There is described a substantially horizontal channelway for supporting the material to be smelted, two electrodes of different polarity arranged transversely to the channelway, a positively acting feeding device arranged to force the material to be treated into the channelway at one end and between the electrodes, and a discharging pit arranged at the opposite end of the channelway and opening into it.

551,020. Electro-magnet. Samuel T. Wellman, Upland, Pa. Application filed April 18, 1894.

The top plate, two poles of the magnet secured thereto, wrappings of wire for each pole, a bottom plate through which the cores extend, and a shell mounted between the top and bottom plates and surrounding the wrappings of the magnet are features claimed.

551,021. Electric Rail Bond. William H. Wiggin, Worcester, Mass. Application filed May 22, 1895.

The first claim follows: An electric rail bond comprising a bond wire or rod and four loose sleeves or collars, two at each end thereof, each set of said sleeves or collars consisting of an outer sleeve or collar, having a tapered hole converging in the direction toward the body of the bond wire or rod, and an outwardly projecting annular flange or rim at the opposite end from said bond wire or rod adapted to fit against the rail flange when the sleeve or collar is fitted in the opening in said rail flange, and an inner sleeve or collar having a straight opening adapted to fit the end of the bond wire or rod, and made taper-shaped upon the outside corresponding to and fitting in the tapered opening of the outer sleeve or collar, with the transverse outside diameter of the inner sleeve or collar a trifle larger than the opening in the outer sleeve or collar.

551,029. Electric Arc Lamp. William J. Davy, London, Eng. Application filed April 19, 1895.

The carbon holders are connected together by a flexible connection passing over a pulley and the carbons tend to approach; the friction grip device consists of two parallel nipping surfaces moving with the pulley, a nipping lever having a notch fitting loosely on the nipping surfaces and pivoted parallel to the nipping surfaces, a means for determining the position of the lever pivot according to the resistance of the arc and of a stop on which the notched end of the lever rests.

551,032. Cleat for Electric Wiring. James R. Hemphill, Akron, O. Application filed September 26, 1895.

The device is formed in one piece, and has a wire receiving recess tapered or reduced in width toward its inner end, and curved or pitched downwardly.

551,033. Commutator Brush. Robert Hirsch and Herman Meminger, Milwaukee, Wis. Application filed January 28, 1893.

It is composed of alternating sections or strips of a lubricating and scouring composition, and of metal inclined or offset to the plane of rotation of the commutator, so as to produce a continuous and approximately uniform area of metallic contact to the commutator in the direction of the width of the brush.

551,046. Electric Arc Lamp. Frederick N. Pike, New York, N. Y. Application filed June 27, 1894.

An arm comprising a longitudinal portion and a transversely extending portion, a carbon support secured to the transversely extending portion, a carbon support movable lengthwise of the longitudinal portion of the arm, a screw engaging with a nut supported by the second carbon support, ratchet wheels secured to the end portion of the screw, solenoids whose cores are provided with pawls for actuating the ratchet wheels, and means for producing a vibratory movement of the cores to actuate the screw.

551,053. Electric Controller. Sidney H. Short, Cleveland, O. Application filed August 26, 1895.

The combination is claimed with a series of rotary contacts made of magnetic material, and a series of magnet poles arranged with relation to the contacts, whereby a complete magnet circuit comprises two of the magnet poles and two of the contacts, and contact fingers having their free ends located within the magnetic fields thus produced.

551,054. Electric Controller. Sidney H. Short, Cleveland, O. Application filed August 27, 1895.

One claim is for the combination with rotary contacts of magnetic material and a series of contact fingers, of an electric magnet having a series of pole-pieces terminating in proximity to the contacts, each pole-piece being slotted for the reception of the free end of a contact finger.

551,056. Multiple Switchboard System. Theodore Spencer, Cambridge, and Thomas C. Wales, Jr., Boston, Mass. Application filed March 18, 1895.

Features specified are: Two telephone circuits, each extending from a sub-station to the same central station, and completed or closed through a section of conductor common to both, which includes an electrical generator and four repeating induction coil windings interposed respectively between the two poles of the generator, and the conductors of the circuits having two of the four windings included in each of the two circuits in inductive relation to the other two windings.

551,060. Telephone Circuit. John S. Stone, Boston, Mass. Application filed July 6, 1895.

In a centralized battery telephone system, the combination with two main line conductors extending to a sub-station, forming severally the two conductors of a metallic talking circuit connected in parallel with one another to constitute the single main line conductor of a supply circuit having a ground or independent return conductor, and containing the main source of current supply, of a retardation or impedance coil having its two ends united to the two sub-station ends of the the main conductors, and its middle to their common earth terminal or return conductor, the sub-station transmitter connected in the terminal conductor, and two electrolytic or polarization batteries connected in independent shunt circuits extending from different sides of the transmitter to the two main conductors respectively.

551,090. Signaling Apparatus. Bernice J. Noyes, Boston, Mass. Application filed September 11, 1889.

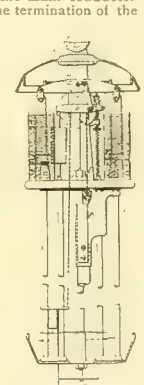
A multiple signal transmitter, a pointer and switch moved by the pointer, and a retarding device which is operatively connected therewith in certain positions only are combined with a signal receiving apparatus connected with the multiple signal transmitter by an electric circuit, the signal receiving apparatus comprising a register and a bell.

551,123. Successive Non-interfering Signal Box. William H. Kirnan, Brooklyn, N. Y. Application filed August 18, 1890.

A circuit controller, a normally wound motor therefor, a releasing device for the motor, a magnet in the signal circuit at the transmitter, a normal short-circuit for the magnet, and a circuit breaker operated by the first movement of the transmitter are the features.

551,145. Switch for Underground Electric Railways. Alfred Rosenholz, San Francisco, Cal. Application filed April 12, 1895.

The invention consists of a stationary magnetic core projecting from the main conductor, a sealed casing therefor, fulcrumed and turnable in journals or bearings about the main conductor, a flexible insulating sheath or jacket surrounding the junction of the main conductor and core, and a ring and groove joint at the termination of the sheath within the casing.



NO. 551,020.

551,166. Joint for Insulated Electric Wires. Raymond S. Kelsch, Chicago, Ill. Application filed December 22, 1894.

An externally threaded sleeve is provided with a jam nut and a sleeve provided with a swiveled nut to receive the externally threaded sleeve and be engaged by the jam nut to clamp the parts securely together, the sleeves having flaring openings through them to receive and hold in contact the flared and jointed ends of conductor sections, and an envelope for the coupling, comprising separable box members, with means for securing them together, affording a chamber for insulating material and fitting at its ends the conductor sections.

551,168. Trolley. David Lippy, Ira E. Finfrock, George A. Rinehart and David R. Francis, Mansfield, O. Application filed September 24, 1895.

The pivoted mast, the spring device for swinging the mast upward, a chain connecting such device and the mast, and a roller on the mast pivot in the path of the chain when the mast is swung down.

551,169. Trolley. David Lippy, Ira E. Finfrock, George A. Rinehart and David R. Francis, Mansfield, O. Application filed September 24, 1895.

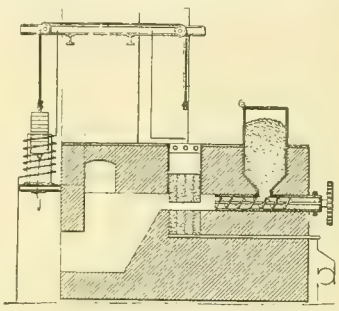
The combination is claimed of the pivoted mast, a shaft having two radial arms connected with the mast, and a coiled spring for rotating the shaft.

551,170. Switch for Electric Plants. Austin H. Lucas, Pittsburg, Pa. Application filed January 4, 1895.

This arrangement comprises a series of pairs of contacts adapted to be connected to a like series of generators, a second series of pairs of contacts arranged parallel with the first series, a shaft or rod arranged parallel with the series of contacts and provided with a longitudinal groove and with a series of transverse grooves, a pair of arms having one end mounted on the shaft or rod, and each having a pin or key adapted to fit the grooves, the transverse grooves being so arranged as to permit of a rotation of the arms on the shaft only when the arms are in line with a pair of contacts.

551,192. Telegraph Relay. Archibald D. MacDonald, Melbourne, Victoria. Application filed November 2, 1894.

When at a state of rest a horizontally arranged pivoted armature lever is adapted to oscillate vertically between cores, placed one above another, the lever being fulcrumed on one side of the cores, and having on the other side contact points and a tension spring, the latter vertically set above the end of the lever, and on the other side of the fulcrum an arm or extension of such weight as to act as a counterpoise to the first named side of the lever and allow the latter to rise up against the back stop when the spring is regulated to exert an upward pull.



NO. 551,014.

551,203. Electric Switch. John E. Criggal, Springfield, Mass. Application filed January 15, 1895.

There is described the combination with a supporting base of a pole piece having a contact face substantially in the path of movement of the circuit controller, a circuit controller having a reactive connection with the base, and movable with the actuating lever, and transversely resilient toward the contact face of the pole piece, and having its contact face movable substantially in the plane of the contact face of the pole-piece, and an actuating lever pivoted on the base for closing the circuit controller, and normally holding the circuit controller against free, reactive movement, and also adapted to release the same at a predetermined point in the backward movement of the actuating lever, whereby the circuit controller has a sudden and multiplied releasing movement in the direction and independently of such movement of the actuating lever.

551,244. Electric Arc Lamp. William P. Wiemann, Washington, Pa. Application filed April 17, 1895.

In an arc lamp, the combination with the rod controlling mechanism of a releasing point therefor, and means for automatically changing its position as the carbon decreases in weight.

551,263. Anti-sparkle Commutator Compound. John R. Davis, New Iberia, La. Application filed March 30, 1895.

The compound is composed of a fatty substance, a good conductor of electricity mixed with the substance, and chalk to harden the mixture.

551,275. Telephone Transmitter. John Goodman and Henry M. Goodman, Louisville, Ky. Application filed June 14, 1895.

A telephone transmitter is described, consisting essentially of two magnets, the one fixed or relatively so, and the other capable of vibration, the magnets being so collocated and mechanically adjusted that the movable magnet in its vibrations at all times remains equi-distant from the adjacent parts of the stationary magnet, a vibrating diaphragm to which the vibratory magnet is mechanically connected or related, and finely comminuted magnetic material between the two magnets in the magnetic field formed thereby.

551,284. Electric Sunshine Annunciator. Leonard Hunt and Frederick W. Duenckel, St. Louis, Mo. Application filed May 20, 1895.

An electric sunshine annunciator, comprising a suitable base, a pair of uprights mounted upon the base, a pair of balanced bulbs, one on each side of the uprights, tubes connecting the lower ends of the bulbs, a screw-threaded rod fixed to and extending from one bulb to the other, a weight adapted to move upon the screw-threaded rod, an arm extending horizontally from one of the bulbs, an inverted U-shaped metallic wire carried by the arm, and cups adapted to contain mercury located directly beneath the metallic wire, with which the wires from the recording apparatus terminate.

551,334. Electric Railway. Robert Lundell, Brooklyn, N. Y. Application filed June 9, 1894.

Claim 1 reads: In an electric railway a current feeder or main, two sets of sectional trolley conductors arranged in pairs, normally open branch feeders running from the current feeder or main to switches controlled by electro-magnets, circuit connections from one of each pair of sectional trolley conductors through two of the switch operating electro-magnets in series and from the other trolley conductor of each pair to one of said magnets.

551,337. Electrode for Arc Lamps. Thomas G. Portis, St. Louis, Mo. Application filed May 14, 1895.

A pair of electrodes of an arc lamp having their arc ends lightly coated and their outer ends heavily coated.

551,347. Telephone Receiver. Alfred C. Brown, London, Eng. Application filed July 11, 1895.

The combination includes a battery transmitter, a telephone receiver having a diaphragm and buzzer contact to be operated by the diaphragm, a battery, and a switch for closing the connection of the battery through the transmitter or through the buzzer contacts and a coil of the receiver at will.

Western Electrician.

EVERY SATURDAY.

Vol. XVII. CHICAGO, DECEMBER 28, 1895. No. 26

## Use of Static Electricity in a Bottle-labeling Machine.

The machine shown in the illustration on this page and diagrammatically represented in Fig. 2 possesses much interest from the fact that the inventors have attempted to make use of static electricity to attract, one by one, the paper labels pasted on bottles in a labeling machine. A successful bottle-labeling machine would immediately be in wide demand in breweries and other bottling establishments, as it would result in a great saving in labor. One great difficulty that has been met in designing machines of this character is to devise a mechanism that will detach the top label from a pile, so that it may be subjected to the action of a paste roller and afterward attached to the bottle. In the machine under consideration this operation is accomplished by the statically-charged plunger of a solenoid. In practice it is found that the regulation of the slight impulse of static electricity required is a matter of considerable delicacy, as it is, of course, necessary to have each successive charge of the plunger of that polarity which will attract the top sheet of paper rather than repel it. An ordinary glass friction machine is used to produce the static electricity, while the dynamo shown furnishes current to energize the various solenoid coils. In the photographic reproduction the machine is shown as it would appear in labeling beer bottles, although the main driving belt is not attached.

A good idea of the mechanism can be obtained by Fig. 2, which is a reproduction of a central section drawing showing the machine at the extreme outward end of stroke. The traveling paste roller $F^1$ is taking paste by friction from the stationary paste roller below, the latter being driven by a belt from a sheave on the main shaft. A bottle has dropped through the rotary bottle gate $H^1$ and is resting on the rubber-lined table or machine bed; a label is shown lifted from the pile by means of a static electric current and the solenoid $D^1$, which at this time is energized.

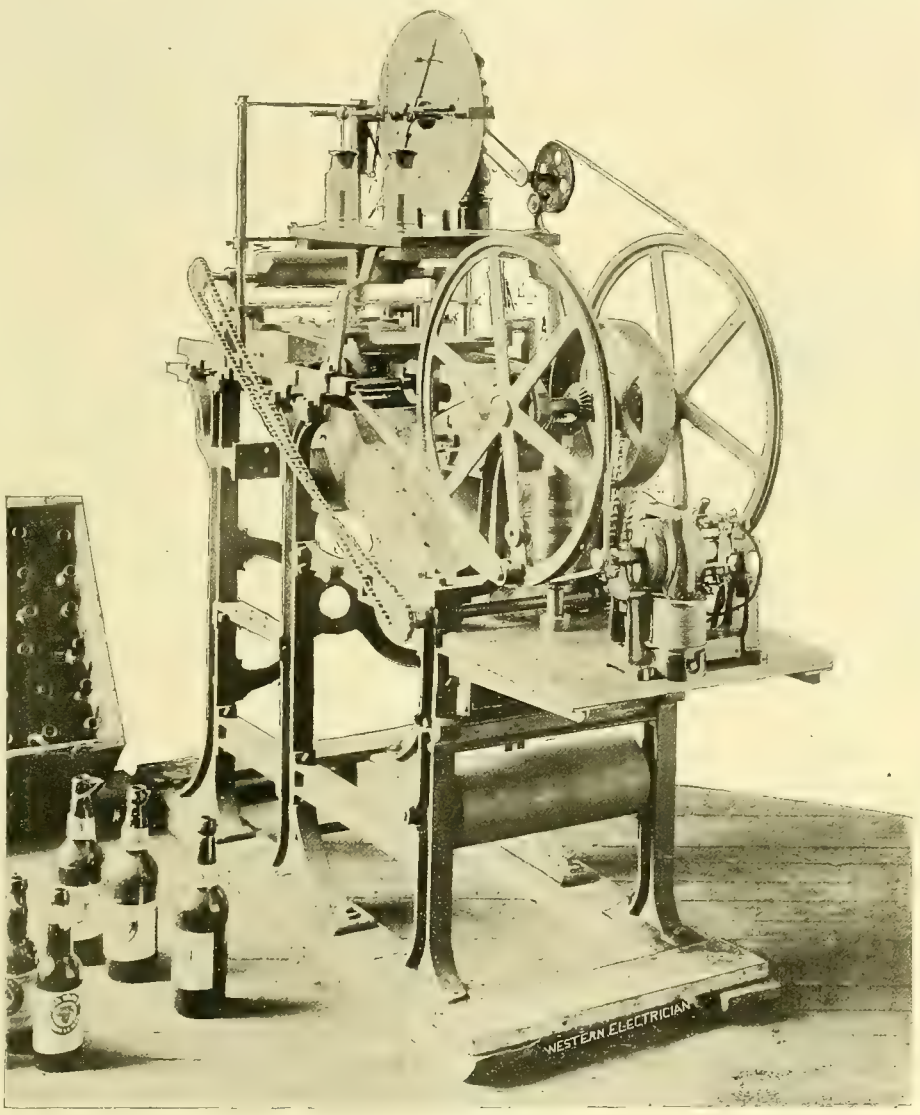


FIG. 1. USE OF STATIC ELECTRICITY IN A BOTTLE-LABELING MACHINE.—GENERAL APPEARANCE OF MACHINE.

The machine in this position, the operation is thus described:

The solenoid $D$ is energized, reciprocating the core $d$ downward so as to approach one side of the top label in the label-box or holder, being the side opposite to the cleat or shoulder $b^1$. The plate $C^2$ at this time is understood to be at its extreme limit of stroke to the left. The ends of the plunger or core are charged with electricity, and, according to the well-known law, the top label is thereby attracted or lifted up at one side by the plunger or core, after which the solenoids $C$ are energized and the plate $C^3$ caused to advance underneath the label thus attracted, thereby separating the top label from the second and the pile of those immediately beneath. The lifting of the label is clearly shown in Fig. 2, in which the relative position of parts is illustrated just previous to the reciprocation of the slide-plate to the right between the top and the second label. This reciprocation of the plate is the next movement in the sequence of operations of the machine.

A horizontal frame $E$ is mounted upon the machine bed or frame and is provided with horizontal guide-ways $E^1$. This guide-frame is designed to permit of the reciprocation of a cross-head carrying a paste roll and a device for rolling or pressing the bottles over the labels. This cross-head consists of a frame adapted to slide in the channels or ways of the frame $E$. The bottle-rolling and engaging device consists of a horizontal plate $F$, which is termed a pressure plate, arranged above these guides and pivotally connected thereto by means of links $f$ $f^1$, whereby it may have both a swinging and a reciprocating motion. The links $f^1$ are somewhat longer than the links $f$ and are extended below the point of connection with the cross-head frame, where they are provided with suitable bearings to receive the gudgeons or short shafts of the traveling paste roller $F^1$.

At the right-hand of the machine is mounted the driving mechanism, consisting of suitably journaled pulleys $G$ $G^1$ rotated by means of the belt $G^2$ connected to a desired source of power. These pulleys operate other pulleys and sprocket wheels which are necessary to drive and actuate the various mechanisms of the machine.

The paste roller $F^1$ is actuated by means of the crank arms $f^2$ connected respectively to the crank pins $f^3$ on the drive wheels or pulleys $G$ $G^1$ and to the shaft of the roller below the pivotal point of the link $f^1$. Within a suitable paste box or receptacle of the proper shape or dimensions is journaled a rotatable paste roller $F^2$, whose lower periphery dips into the paste at all times and whose function is to feed paste by its constant rotation to the other roller when brought into close proximity. As shown, motion is communicated to the roller $F^2$ by means of a belt running around a pulley on the main shaft.

At the extreme left of the machine is the bottle feed chute or incline $H$, which is supported at the required elevation. At the mouth or open end of this chute is a device which may be termed a bottle gate and which consists of a rotatable roller $H^1$ mounted in suitable bearings in upright standards $h$ secured to the machine frame. This roller is cut away partially, so that it is somewhat semi-circular in cross-section, to accommodate it to the particular article here to be labeled, that is, a bottle. It is obvious that when the full face of the gate is presented to the bottles pressing thereagainst by gravity, the bottles will be held in the chute, but that when the opposite face is presented a single bottle will be allowed to pass or fall through to the bed of the machine, to be operated upon by the label-attaching devices proper. It will be understood that the particular contour of the gate may be altered to suit circumstances and the character of the package or article to be labeled. The roller may be rotated by any suitable connection with the driving mechanism, as, for instance, by the sprocket chain running around a sprocket wheel and around the wheel $h^3$ driven by pulley $G^1$. The various pulley and sprocket wheels are so made that they will cause the mechanism which they control to operate at the proper predetermined times.

Forward of the label box is arranged the bottle delivery, which consists of an inclined chute $J$ leading from the machine bed downward to a horizontally traveling endless belt or apron $J^1$, forming a continuation of the delivery and adapted to carry the bottles to the place desired. At equidistant points along the apron are a series of upright fingers $j$, which are preferably covered with rubber or other cushioning material to separate the bottles, or to prevent their breakage by coming into contact with each other or by their descent in the inclined chute. As shown, the apron is operated by means of the pulley $K$, which is rotated by the sprocket wheel $K^2$, receiving its motion from the sprocket wheel $k^1$ on the shaft $k^3$.

The pressure plate is provided with a series of removable plates or strips, the middle plate being shown removed to allow the plunger or core to pass therethrough. The object of these plates is to accommodate the different sizes and widths of labels used, as it is desirable that the plunger should approach the label at substantially the middle point of one side

or edge. To this end the position of the solenoid and plunger may be shifted and the plate or strip directly beneath the plunger may be removed as desired.

A dynamo $G^3$ is connected to one of the main drive-wheels or pulleys in order to supply the necessary current to operate the solenoids, although the current may, if desired, be derived from an independent source.

In all present label machines it is impossible to attach labels of different shapes without materially altering the machine or reconstructing it, but in this machine any shape of label may be equally provided for. For instance, take a diagonal or circular label, where the paste is liable to be smeared over the plate not covered by the label. In the electrical machine such a label can be readily provided for by attaching to the upper face or the slide-plate a thin supplemental plate having the same shape of contour as the label that is to be attached, so that the label alone will receive paste.

The bottle is first admitted from the feed chute through the gate and allowed to fall upon the bed of the machine. At this instant the plunger is reciprocated downward to approach the top label in the box, and simultaneously the earth connection of the static machine is broken by the rotating switch device, thereby charging the plunger with static electricity. The relative position of parts at this stage of the operation of the machine is shown in Fig. 2, in which the top label is seen to be attracted and held up by the plunger. Next, the circuit in which the solenoids *C C* are interposed is completed by the switch device, and the solenoids are

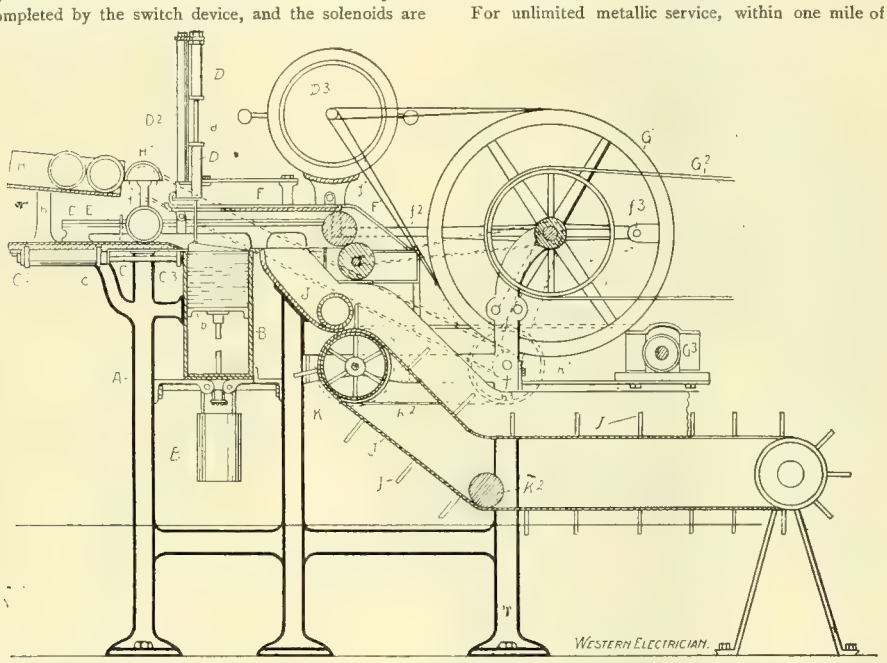

FIG. 2. USE OF STATIC ELECTRICITY IN A BOTTLE-LABELING MACHINE.—CENTRAL SECTION DRAWING.

energized, drawing in their cores and reciprocating the slide-plate beneath the label thus attracted or lifted. Immediately the traveling paste roller is caused to pass over the label and apply paste thereto. In the withdrawal of this roller, the pressure plate is caused to swing downward by reason of the peculiar manner of pivoting it upon links, in one set of which the paste roller is journaled. In thus swinging down, the frame engages the bottle, and in its reciprocation—being drawn to the left during the withdrawal of the paste roller—presses and rolls the bottle over the label. The bottle thus picks up the label, which is firmly pressed upon and attached to the bottle in the rolling operation to which it is subjected. On reaching the proper opening in the machine bed, the bottle falls downward into the delivery chute, from which it is carried to the place desired by the communicating delivery apron or carrier.

The diagram does not show the electrical circuits nor the construction of the rotatable circuit breaker, which is in the form of a cylinder having contact points or strips on its periphery whereby the solenoid circuits may be successively or alternately made and broken in order to reciprocate the cores so as to cause the various parts of the machine to operate at proper pre-determined intervals.

The machine may be run at 60 revolutions per minute, and it is estimated that it will label 36,000 bottles a day. It is in charge of J. Francis Small, Chicago, one of the inventors.

---

Robert Gillham was allowed $12,500 by Judge Henry of Kansas City for his services as receiver of the Northwest electric railway during the 25 months ended October 1st. He was paid at the rate of $500 per month. Mr. Gillham's report shows the receipts of the road during that period to have been $94,611.22, and there is now $2,715.38 on deposit to the road's credit. During the last eight months 34,424.19 was collected in fares.

## Wisconsin Telephone Company.

[From the Milwaukee correspondent of the WESTERN ELECTRICIAN.]

As a result of the organized fight among its subscribers against the claims for extra calls, the Wisconsin Telephone company has made additional concessions, and the prospect of an amicable adjustment of all points in controversy is good. To the committee which represented the Telephone Users' association the company made a number of propositions in detail. The main proposition, however, was that that the subscriber to telephone service on the basis of the number of calls shall have the choice of a limit and rebates, or have a limit and pay for all calls in excess of it. In other words, subscribers on the basis of only 1,000 calls a year, and who pay $75 a year in rental, will receive a rebate of 7½ cents for each time that they are entitled to use the telephone and do not do so. The other part of the alternative is the privilege of using the telephone 1,200 times during the year and paying the company 2 cents a call for all calls in excess of that number,

The company divides its service into three classes: Limited metallic service, unlimited metallic service and unlimited grounded service. For limited metallic service, within one mile of the exchange, the charges proposed are as follows: For 500 service messages, $50 for one subscriber and $40 each for two subscribers on the same line; for 600 messages, $57 and $47; for 700 messages, $63 and $53; for 800 messages, $68 and $58; for 900 messages, $72 and $62; for 1,000 messages, $75 and $65.

For unlimited metallic service, within one mile of the exchange, the charges proposed are as follows: One subscriber with special line, $120; two parties on same line, $100 each; three parties on same line, $80 each; four parties on same line, $70. These rates are for business houses. For residences the rates for the same service run from $70 to $45, according to the number of subscribers on the circuit.

For unlimited grounded service, within three-fourths of a mile of an exchange, the business rates are as follows: One subscriber, with special circuit, $72; two subscribers on the same circuit, $66 each; three subscribers on the same circuit, $60 each. The rates for this service at residences are $50, $42 and $36 a year, according to whether one subscriber or two subscribers or three subscribers use the line. The charge per telephone for extra mileage is $10 for business houses and $7.50 for residences for every quarter of a mile in excess of the one-mile limit, and for grounded service the charge is $5 for each quarter of a mile in excess of the three-quarters of a mile limit.

It is understood that the company has since made some further concessions, but just what they are is not known. There is some talk to the effect that the grounded service will be discarded entirely and that more liberal provision will be made in regard to extra calls. Many people think that the company has acted in a very reasonable manner. In behalf of the company it is asserted that its net revenues never exceeded 8 per cent. upon the capital invested and that the annual dividend of the company during the last three years has been only 6 per cent. The new tariff which the company has offered to establish is said to be a reduction of 20 per cent. The company, of course, expects to make up its losses in this respect by a more general use of telephones. The company will probably satisfy its subscribers and thus put an end to the talk of an outside company entering the the Milwaukee field.

## Chicago's Storage Battery Road.

The officers of the Englewood & Chicago Electric Railway company, which will soon have a storage battery road in operation in the southern part of Chicago, report that satisfactory progress is being made, and that some of the cars will be in operation about April 1st.

The company has a franchise for 54 miles of road, and the line, when completed, will extend from the South Park avenue station of the Alley "L" at Sixty-third street and Vernon avenue, through Vernon avenue to Sixty-seventh street, to Vincennes avenue, to South Chicago avenue, to Keefe avenue, to Vincennes avenue, to Seventy-first street, to State street, to Seventy-ninth street, to Vincennes road, to Morgan Park. A portion of the line is already built and supplied with overhead electric equipment, but the new company will operate the whole system by the use of storage batteries on the cars. There will be 50 motor cars and 50 trailers. Each motor car will be equipped with an outfit of chloride accumulators weighing 4,500 pounds and placed on the trucks with two G. E. 800 25 horse power motors. General Electric controllers will also be used, and the same company's generators will be used in the power house, which has not yet been located. The power house engines and the car trucks have not been selected.

The claim is made that in seven minutes the cells can be charged sufficiently to run a car 40 miles. This seems surprising, but the statement is confidently made. By means of little tramcars and elevator platforms the discharged battery can be taken from a car and replaced with a freshly charged equipment in the space of three minutes, it is said. The workmen will have no need to touch the boxes containing the cells. The cars may be operated up to a maximum speed of 25 miles an hour.

The company has opened an office at 813 and 814 Marquette building. Its officers are: President, J. C. Shaffer; vice-president, Judge Old; secretary, C. F. Griffin. In conversation with a representative of the WESTERN ELECTRICIAN, President Shaffer said: "We purpose to demonstrate that a storage battery road can be operated as well, physically, as an overhead trolley electric equipment, and better than a trolley road from a financial point of view. This may seem like undertaking a large contract, but I think that we will be successful and that Chicago will have the first practical storage battery railway in the country—one that, in operation, will attract the attention of street railway men and the public the whole country over. People are prejudiced against the storage battery for traction, but I think we will be able to remove that prejudice. Litigation has very greatly retarded the development of the storage battery, but with one company owning all the patents, and able to embody the best features of all in one cell, we will be able to show what the storage battery can do. We will equip our Chicago road as a model and an example. Everything will be first-class, and we look to the future with confident anticipation of success."

The specifications for track construction are about to be issued.

## Fire Balls Lighted the Ship.

[From the *Philadelphia Record.*]

One of the most remarkable electrical storms at sea, which probably seemed intensified by reason of the fact that a cargo of Spanish iron ore passed through it, was experienced by the British steamship Mercedes, which arrived at this port yesterday from Bilbao. On the Grand Banks of Newfoundland during the nights of December 3d and 4th the ocean appeared like a mighty mass of flames or an endless stretch of prairie fires. Balls of electric fire hissed and exploded in all directions and darted among the vessel's masts and rigging.

The Mercedes' escape from going down on December 1st seemed little short of a miracle. She was struck by a south-southwest gale, which was accompanied by seas rolling fearfully high. During the height of the storm a huge deck derrick, weighing many tons, was torn loose from its fastenings and swept overboard, leaving a hole in the vessel's deck through which the water ran into the cargo. In its course it carried away the main topmast, which was also of iron, part of the flying bridge, the after winch and part of the deck fittings. The decks were flooded with tons of water, the ship rolled at an angle of 70 degrees, and the sea broke in all directions, filling the cabin and the officers' quarters.

Soon afterward the storm partially subsided, when the electrical fire appeared in all directions. It hung in big balls for two nights from the masts and fore and aft stays, and practically turned night into day. As the big fire balls came together they would burst with a loud report upon the vessel and disappear. Under this light at night such temporary repairs were made as were deemed necessary to reach port.

Capt. Tait of the Mercedes stated that the passage was one of the most trying experiences of his life. The rolling and lurching of the vessel in the storm and the fury of the gales were terrific in the vicinity of 25° longitude. Only the heroic work of the officers and crew saved the vessel, as all the shipping men about the Maritime Exchange yesterday agreed.

## Magnetic Action on a Current in an Aluminum Wire.

Among the singular properties of aluminum which distinguish it from other metals, is its extremely feeble volatility at high temperatures. While this metal melts at an intermediate temperature between that of zinc and of silver (1,250° C.), it can be carried to a white heat without sensible sublimation and without coating with deep oxide. At this temperature nearly all metals with a lower fusible point are either partially volatilized or materially [illegible].

If a current sufficiently intense to heat it to the point of fusion is sent through a fine aluminum wire, it may be

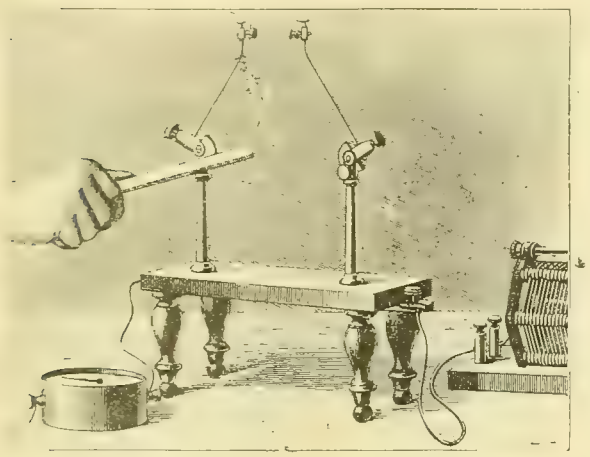

FIG. 1. MAGNETIC ACTION ON A CURRENT IN AN ALUMINUM WIRE.—EXPERIMENT WITH INCANDESCENT WIRE.

driven to a blinding white heat and yet maintain its integrity, unlike other metals similarly affected. These last when tested in a like manner, on reaching their fusing point, suddenly light up and give way, each extremity of the rupture forming into a small metallic globule produced by the contraction due to the superficial tension of the liquefied metal.

Aluminum behaves quite differently. If the wire is held firmly between two supports which are conductors of the current, it will curve inwardly, but will maintain its form in a state of incandescence up to the moment of rupture, which usually occurs near the point of attachment.

The wire in this experiment, Fig. 1, is evidently in a fluid state, oscillating with the least breath, and held in the air by the cohesion of its molecules, probably because of the formation of a very attenuated coating of metal which serves as a sheath or tube around the molten metal. This film must be of extreme thinness, for a microscopic examination failed to discover the least traces of oxidation. It has more the appearance of a rough casting. The surface is in a condition of brilliant ebullition, covered with cracks,

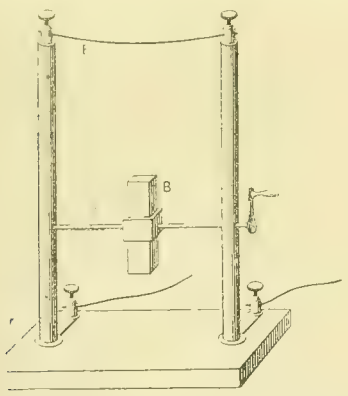

FIG. 2. MAGNETIC ACTION ON A CURRENT IN AN ALUMINUM WIRE.—EXPERIMENT SHOWING ACTION OF MAGNETISM ON A CURRENT.

with here and there a discolored, dark spot, having the appearance of graphite; in other words, the wire is evidently in a species of crystallization. In vacua produced by an ordinary air pump it still maintains its cohesion, as before, but preserves a more perfect homogeneity than in the air.

A wire 25 to 30 centimeters long and three-tenths millimeter thick, fixed by the extremities so as to allow it to form a loop, as shown in Fig. 1, will show another peculiarity when heated to an incandescent temperature. If now we present a bar magnet to the loop, the filament will be either attracted or repelled, depending upon the direction of the current or the pole of the magnet. This action may be sufficiently powerful to cross the loop and thus short-circuit and fuse the filament by reducing its resistance.

Prof. Margot, from whose communication in *La Nature* these facts are condensed, might have mentioned that the ordinary carbon filament in an incandescent globe is also susceptible to the action of magnetism in a similar manner.

M. Guillaume, who contributes some additional information on the subject of heated aluminum, says that the sheath or tube which serves to hold the fused metal in position, is undoubtedly a film of rust, and that this same film is the bar to the ready soldering of aluminum, which in all cases must be perfectly freed from all traces of, and protected from contact with, the oxygen of the air by cleaning and coating its surface at the time of soldering.

This extremely light metal, says the last named contributor, and its persistency of form when thus fused, permit of a pretty experiment, as shown in Fig. 2, where, by rotating the magnet placed above or below a filament so situated, the motion of a pendulum may be imparted to it, or by another application of a magnet one may compel it to assume various curves.

## Pacific Cable Company.

The Pacific Cable company was incorporated at Trenton, N. J., December 16th, with a total capital stock of $1,000,000, divided into 10,000 shares, the names of the incorporators and the amount of stock held by each being: Abram S. Hewitt of New York, 1,500 shares; D. O. Mills of New York, 1,000 shares; G. M. Dodge of New York, 1,000 shares; Fred D. Grant of New York, 500 shares; Wager Swayne of New York, 500 shares; James J. Hill of St. Paul, Minn., 1,000 shares; Z. S. Spaulding of San Francisco, 2,500 shares; John H. Browning of Tenafly, N. J., 1,000 shares, and Mason W. Tyler of Plainfield, N. J., 1,000 shares.

The object of the corporation is stated in the papers filed to be the construction and operation of electric submarine cables in the Pacific ocean with telegraph lines and connections for the transmission of messages. Connection, it is understood, will be made with the Hawaiian Islands. Offices are to be maintained in Jersey City and San Francisco, and business will be commenced on January 1st.

Ex-Mayor Hewitt of New York, who is one of the largest shareholders in the new cable company, is quoted as saying:

The government of Hawaii has granted to Col. Spaulding, a well-known planter of the Hawaiian Islands, a concession for a cable to the United States, with a subsidy of $40,000 a year. Col. Spaulding came to New York for the purpose of forming a company to lay the cable, but a subsidy of $40,000 a year is certainly inadequate to pay the interest on the outlay and expense for maintenance, which it is estimated will be about $300,000 a year. In the last Congress a bill was introduced and passed by the Senate authorizing the president to contract for a cable to the Hawaiian Islands at a cost not to exceed $3,000,000. The bill failed in the House, where it was thought that a corporation would be a better agency for securing a cable, because, for commercial and general purposes, government ownership and general management are not desirable.

Col. Spaulding's idea is to apply to the government of the United States for a sufficient subsidy to warrant the laying of the cable and for its maintenance. As the enterprise is of great public and commercial importance, several prominent gentlemen have agreed to co-operate with Col. Spaulding and to furnish the money required, provided the subsidy is secured. Their object, however, is not to make any money out of the enterprise, and hence, in the bill which will be presented to Congress, provision is made that the United States government may at any time release itself from the subsidy by taking the cable from the company at the actual cost of construction.

In other words, the object of these gentlemen is to secure to the United States the advantages of cable communication with the Hawaiian Islands, in the hope that the cable at some future time may be extended to Australia and China, with which countries we have large and growing commercial relations.

## Philadelphia Street Railway Strike.

A dispatch from Philadelphia on the 20th stated that the great street railway strike was over, as the Union Traction company, owner of the street car lines involved, had consented to arbitrate the differences with its employes. The cars were then running as usual. There were a few cases of violence and a number of cars were run out under police protection.

A later dispatch, however, gives the information that the company repudiated the arrangement for settlement, and that the situation is unchanged. Public sentiment seems to be with the strikers.

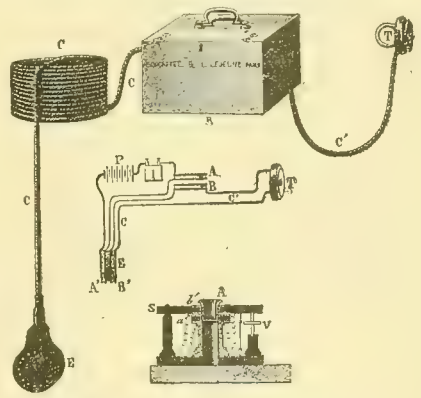
## Electric Submarine Explorer.

This apparatus is based on the principle of Hughes' induction balance, and is intended, according to *L'Eclairage Electrique*, for the discovery and location of metallic masses, sunken vessels, anchors lost in the ocean, and metallic veins. Like Hughes' induction balance, it is composed essentially of two pairs of bobbins, *A B* and *A' B'* Fig 2. The bobbins *A A'* are the inducing coils, the direction of the windings being such that a current through these flows in contrary directions. In the primary circuit a battery *P* and a clockwork interrupter *I* are placed, with a toothed wheel and platinum spring contact, which interrupts the current. Lying parallel and in close proximity to the coils *A A'* are the secondary or induced coils *B B'* in the circuit with the telephone *T*. The interruptions or variations of resistance produced in the circuit of the primary develop induced currents in the secondary, and the effect is distinctly noted in the telephone *T*. But if the winding of *B B'* or the contacts are such that the action of *B* on *B'* balances that of *A* upon *A'*, or, in other words, when the induced currents destroy each other completely the telephone remains mute.

Now by constructing the four bobbins as exactly similar as possible, and regulating the distance between *A* and *B*, through the adjuster, Fig. 3, this condition of silence in the telephone is obtained.

The apparatus being thus regulated, if we approach one of these groups with a metallic mass, the equilibrium is at once disturbed, and the telephone gives notice of it, the sounds varying in intensity according to the size, distance and orientation relative to the bobbins.

The explorer here described comprises all these parts. In Fig. 1 the box *B* contains the adjuster, the battery and



FIGS. 1, 2 AND 3. ELECTRIC SUBMARINE EXPLORER.

the vibrator, the whole being portable. The fixed bobbins *A' B'* are closed in insulating compound, waterproofed, and attached to the extremity of a long cable *C*, as shown, and may be used to explore the crevices of mines, the bottom of a river or the bed of the sea, with equal success.

## Chicago North Side Electric Elevated Road.

Work has been begun at Fullerton avenue on the erection of the structure of the Northwestern "L." Officials of the company say that work will be pushed with such rapidity that trains will be running by January, 1897. It is announced that the trains, when put in operation, will run south on Fifth avenue to Van Buren street, and on Wabash avenue from Harrison street north to Lake street.

Work on the road has been rushed for several weeks past. All but about the space of two miles is provided with foundations for the superstructure. The contractors who are putting in the foundations are engaged in doing the same work for the Fifth avenue and Wabash avenue sides of the union loop. More or less delay has occurred in the work down-town, owing to the obstacles presented by the mass of conduits in the streets named, but it is understood that the contractors will soon be able to transfer a portion of their men to the North Side work.

Much of the iron material for the Northwestern "L" is already on the ground. The structure will be pushed north at first, and as soon as practicable another gang will be put on to work southward from Fullerton avenue.

The running of trains to Van Buren street and Harrison street implies the use either of Clark street or Pacific avenue from Van Buren to Harrison street. The property owners on Van Buren street have nearly all, it is claimed, signed the agreement drawn up by the executive committee of the association to resist the loop.

The Owatonna, Minn., electric light plant was recently compelled to shut down owing to its well giving out.

## Transmission of Energy by Polyphase Currents in the Soignies Quarries.

Some of the most interesting electrical transmission plants of Continental Europe are to be found in stone quarries, where the advantages of electrically transmitted power are particularly obvious. One of these was described in a recent paper read before the Association des Ingenieurs Electriciens of Liege, Belgium, from which the following abstract is translated:

The territory under consideration has an extent of 52 hectares, and was formerly all operated by a central steam

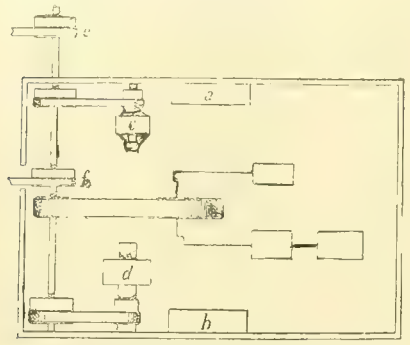


FIG. 1. TRANSMISSION OF ENERGY BY POLYPHASE CURRENTS IN THE SOIGNIES QUARRIES.—PLAN OF ENGINE AND DYNAMO ROOM.

plant, with a consumption of four to five kilogrammes per horse power hour. The present plant, which is electrical, performs the same labor with a consumption of less than one kilogramme. This saving is worthy of investigation.

The boilers are three in number, Cornwall-Galloway type, with two fire chambers, each with a surface of 80 square meters, the doors being automatically held closed except when proper attention to the draft has been first given, which prevents careless firing.

The water of condensation is not alone utilized for feeding the boilers. The source of this supply is 200 meters distant. The water is forced over by a pump into a tank on the roof of the main building. Part of this water under pressure furnishes smaller boilers of crane machinery, locomotives, etc., distributed through the quarries.

The steam engine is compound and parallel with a variable cut-off, and has a capacity of 350 horse power. The flywheel weighs 12 tons and has a diameter of five meters; it is placed between the two cranks and transmits its power by a cotton belt. As shown in Fig. 1, the pulleys at the extremes of the shaft within the dynamo room carry severally, the one the triphase alternator *d*, the other the illuminating dynamo *c*. The two pulleys *f* and *e* drive the saws.

The continuous current dynamo is of the tetrapolar type, shunt wound, with drum armature, and having two brushes. This generator developes 300 amperes at 125 volts—or 37.5 kilowatts. Only one-half this power is used for lighting. The machine is remarkably compact for its capacity, but the neutral line is extremely sensitive to variations of load, and there is constant necessity for watching the brushes.

The triphase generator is of the Oerlikon type, with fixed armature and inner revolving field. The cast-steel inductor is composed of two equal parts—a crown of north

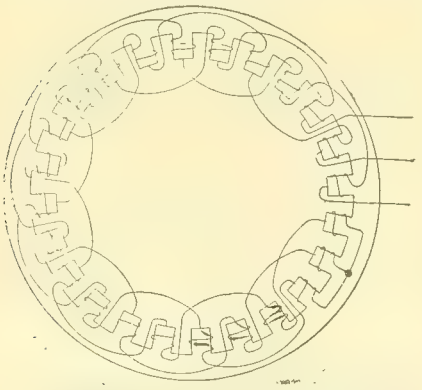

FIG. 2. TRANSMISSION OF ENERGY BY POLYPHASE CURRENTS IN THE SOIGNIES QUARRIES.—WINDING OF TRIPHASE GENERATOR.

and one of south poles; the exciting spool, well ventilated, is completely protected from exterior damage. The exciting current is led to two rings, and is produced by a small dynamo of the horseshoe type, of which the armature is fixed on the shaft of the alternator and the fields on a bracket cast on the frame. The alternator, with full load, requires an induction current of about 10 amperes at 35 volts. The surfaces and the pole-pieces are of laminated soft iron, the pieces being first riveted together and then forced into the curved forms.

As to the winding of the armature, there is no essential difference between the triphase and the ordinary alternator. The number of poles of the field is 16—eight north and eight south—while the armature has 24 poles. Consequently the arc corresponding to one complete period is thus divided into three parts, resulting in three phases. The difference, then, is two-thirds between any two currents, and the spools may all be wound in the same direction. Fig. 2 shows the connections, except that the wires figured as being within the circle are in reality at the opposite extremities of the coils. The coils are wound separately, slipped on the cores and fastened, wedges and leather sheaths holding them in place.

For high tension (5,000 volts at the poles of the dynamo, without transformers), the spools are wound with wire, but for the medium tensions bands of copper are used, while for the lowest—below 100 volts—the construction is slightly modified; bars are used in place of bands.

The coils are connected in the star form. The pairs of poles being eight and the speed 360 revolutions the frequency is of course 45.

The maximum load of the machine corresponds to 250 amperes in each branch; the theoretic energy then is $3\times250\times220=165{,}000$ watts, or about 246 horse power at the shaft, but the efficiency realized is less and divided as follows:

| | |
|---|---|
| Illumination | 57 horse power |
| Sand saws | 50 " " |
| Diamond saws | 45 " " |
| | 152 |

The distribution board is a model of simplicity. There are four ammeters with a range of 120 singly, one for each branch line from the bus-bars, four tripolar switches, one general ammeter, one voltmeter having one of the terminals connected to the neutral point of the star, the other to one of the poles of the dynamo by means of a switch.

The cut-out fusibles are behind the board. Twelve

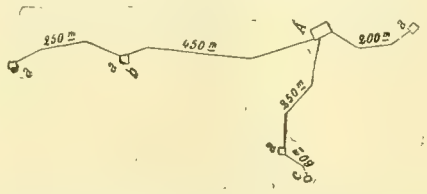

FIG. 3. TRANSMISSION OF ENERGY BY POLYPHASE CURRENTS IN THE SOIGNIES QUARRIES.—MAP OF POWER CIRCUITS AND MOTORS.

lightning arresters are connected to one plate where the aerial lines enter the power house. There are also measuring instruments on the exciter lines. The tension of the machine is hand regulated on the exciter circuit by the aid of a rheostat.

The installation comprises six motors, as follows:

(*a*) Four motors of 24 horse power, or 96 horse power.
(*b*) One motor of 18 horse power, or 18 horse power.
(*c*) One motor of 9 horse power, or 9 horse power.

Total.....123 horse power.

The drop from the generator being about 7 per cent. there is left a reserve of about 25 kilowatts.

Fig. 3 shows the comparative distances from the power house *A* to the various motor installations, *a*, *b*, *c*. The maximum distance is seen to be 700 meters. The motors are all hexapolar.

Finally, from a technical and economical point of view, from the cost of installation to the final results, as between the continuous and alternate currents, there is little to choose. The only advantage lies with that system which can furnish the lightest and simplest motors.

The Soignies quarries is the first industrial institution in Belgium where the alternating current has been used, and the projectors are entitled to much credit for their daring in thus hazarding the experiment.

## Postal Telephony.

*To the Editor of the* WESTERN ELECTRICIAN:

A communication from G. C. Maynard, as Washington correspondent of the *Electrical Review*, endeavors to discredit the writer in connection with a statement that the postmaster-general had considered some the question of postal telephony. As this G. C. Maynard is well known in Washington to be a Bell telephone man, it is to be expected that he would assume such statements. However, he has a few things to learn yet in the telephone line, although he probably thinks he knows it all, like most of his "kit." It is sufficient to state that the inferences of his communication are false, and that the postmaster-general was either guying him or did not think his interest in an effort to obtain information warranted the giving. The postmaster-general and the writer did discuss matters of postal telephony.

J. E. KEELYN.

## Cost of Operation on the Metropolitan Elevated Road.

The Metropolitan West Side Elevated Railroad company of Chicago, using electrical power exclusively, has shown that an elevated electric railway can be successfully operated during the storms of a northern winter. It is known, too, that a great saving is obtained by generating the power in one station and by discarding steam locomotives and high-priced enginemen and firemen. The exact figures of the cost of operation have hitherto been withheld from the public, although eagerly awaited. The *Chicago Tribune*, however, claims to be in possession of some general figures on the subject. The article is rather indefinite, but it is of considerable interest, nevertheless, and is herewith given:

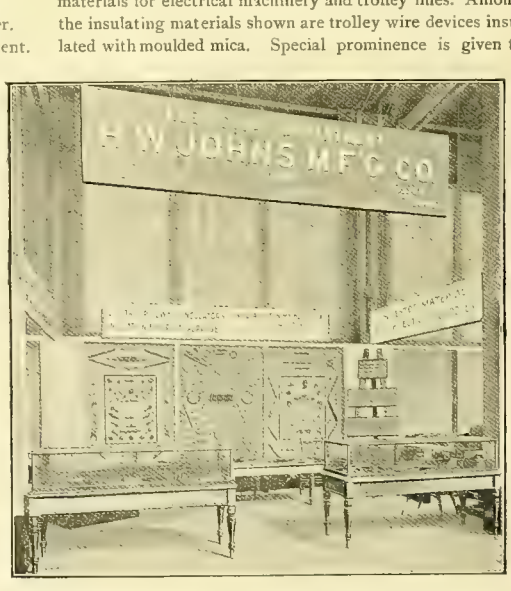
The Metropolitan Elevated railroad is operating trains on its line at 22 cents a train mile. The cost for operating the Alley "L" is 47 cents a train mile, and for operating the Manhattan Elevated in New York it is 45 cents a train mile. This shows a cost of less than one-half the cost of operating with locomotives, and it is said the expense will be further reduced when the southwestern branch is in operation and when the tunnel connection with the Chicago river is completed and the company is able to secure water needed without cost. The Metropolitan officials will not give out the absolute passenger traffic of the road. They say, however, it is averaging more than 55,000 a day, and that the traffic for November and the first half of December was sufficient to meet all fixed charges and to pay interest upon the present outstanding issue of bonds, amounting to $10,000,000. The company is progressing with its southwestern branch, and already it has nearly all the foundations in for the portion of this branch running from the main line south to Twenty-second street. The last of the condemnation suits has been completed, and the company can begin work upon the superstructure as soon as it may desire.

On the branch running west along Twenty-second street nearly all the right of way has been secured, and it is expected the company will have this branch in operation in the early spring. The cost of generating electrical power will not be materially increased when the Douglas Park branch is in operation. It is expected the cost of operation will be reduced to 20 cents a train mile when all the system is in operation and when certain improvements are made which are now in contemplation.

This showing of the Metropolitan gives an idea of the saving in cost to be effected by the Lake Street when the road begins the operation of its trains by electricity. While the exact proportion of operating expenses to gross income of the Metropolitan is not known, it is said to be between 45 and 50 per cent. The operating expenses of the Lake Street during last year amounted to a little more than 67 per cent., and while predictions were made that this would be considerably reduced during the present year it was not expected it could be cut lower than 60 per cent., if that low. The operating expenses of the Alley "L" have been exceedingly heavy, running from 75 to 80 per cent. of the passenger receipts. With a good electrical equipment this could be cut to 50 per cent., and perhaps even lower.

## H. W. Johns Manufacturing Company at Atlanta.

One of the exhibits in the electricity building at the Atlanta exhibition which has attracted attention has been the electrical exhibit of the H. W. Johns Manufacturing company, which shows an attractive arrangement of insulating materials for electrical machinery and trolley lines. Among the insulating materials shown are trolley wire devices insulated with moulded mica. Special prominence is given to



H. W. JOHNS MANUFACTURING COMPANY AT ATLANTA.

the giant strain insulators with their combinations for clevis and large eye. Also the "J. P." hanger, which was introduced during the last year. Special attention is also ealled to the "H. W. J." mechanical clip, which has proven most satisfactory in service.

A large and comprehensive display is made of vulcabeston parts used in the controllers of various manufacturers,

the list practically including the makers of all controllers, such as the Westinghouse, General Electric, Steele, Sperry, Worthington, Walker and the Curtis Electric companies. There are a number of specimens of brass switches and crossings and the Philadelphia insulated crossings and trolley wire breaks. These are insulated with specially impregnated fiber, which renders the fiber non-absorbent.

The company exhibits a novel form of car heater, which consists of a resistance wire, interwoven with and insulated by asbestos. Tests have shown these heaters to be most economical, and also permit the use of a high temperature without detriment. Included in the exhibit is a device which introduces a new name to the trade—electrotherms. These are practically resistance mats, or pads, and are composed, like the car heaters, of a resistance wire insulated with asbestos. They are flexible and are covered with flannel or rubber, depending upon whether they are to be used for local applications of heat or in damp situations. They are specially adapted for medicinal purposes.

In glass cases are shown samples of moulded mica and Monarch insulating materials in a great variety of shapes for the insulation of switches, thermostatic and other devices, and vulcabeston parts as used in dynamos, motors, street car controllers and other electrical apparatus.

The company has received for its exhibits at the Atlanta exposition for asbestos manufactures and moulded mica and vulcabeston insulating materials one gold medal for superior excellence, two silver medals, two bronze medals and an honorable mention.

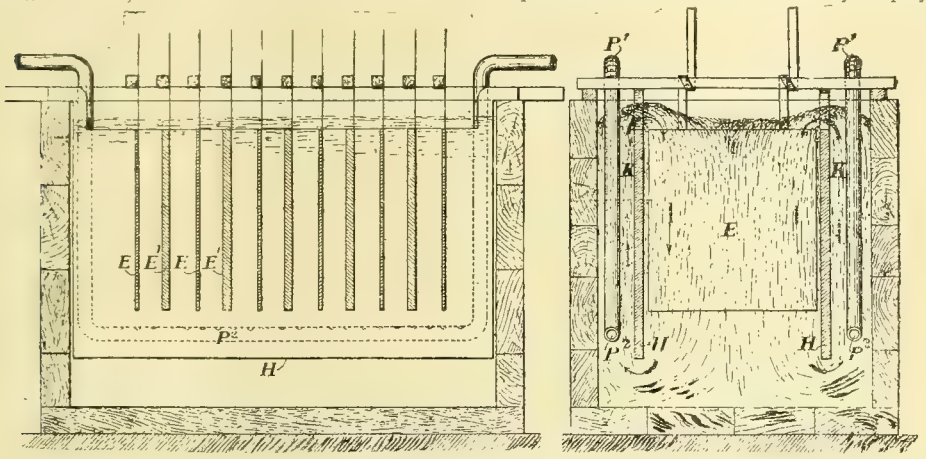


FIG. 2 AND 3. SIEMENS & HALSKE PROCESS FOR PRODUCING ELECTROLYTIC ZINC.—LONGITUDINAL AND TRANSVERSE SECTIONS OF THE CELLS.

## Street Railway Affairs in Milwaukee.

[From the Milwaukee correspondent of the WESTERN ELECTRICIAN.]

The McGann street railway ordinance is still hanging fire in the Common Council. It is expected that the matter will come up, but not for final settlement, at the next meeting of the Common Council. Two members of the committee on railroads, Aldermen Thuering and Devos, will report in favor of granting the franchise, with suitable restrictions, while the other three members of the committee will submit an adverse report. At the last meeting of the committee ex-Congressman P. J. Somers, who represents McGann and his Chicago associates, made a strong attack on the opponents of the new company. He told the aldermen that if they refused to give the people competition in street railway service, and thus prevented them from riding for 4 cents, the people would be sure to remember their course when they came up again for election to their seats in the Common Council. If they had the interest of the people at heart, he said, they would grant the franchise, and thus give relief to this monopoly-ridden city. He declared that there was no good reason why they should not grant the franchise. "However," he continued, "if you are bound to vote against the ordinance, come out squarely and admit that it is because the other company does not want you to give us a chance to compete." Mr. Somers then proceeded to relate how some of the members of the committee went to Chicago to try to ascertain the financial standing of the McGann company. He asserted that instead of going to the banks which had been cited as references, the Milwaukee aldermen had approached one of the conductors on the McGann line, and questioned him. "You might just as well have asked the man who washes the car windows," he said, and there was a laugh at the expense of the inquisitive aldermen. Mr. Somers spoke of the capital which was ready for investment in the enterprise, declaring that it was adequate, and he elaborated upon the financial and personal integrity of C. C. Bonney, the principal backer of the enterprise, who, he said, had looked into the matter and was confident that it would prove a profitable investment.

The aldermen are perplexed. There will be an election for aldermen next spring, and the friends of McGann have worked up considerable feeling in some parts of the city, hence the aldermen fear the consequences, so far as they themselves are concerned, in case they kill the measure. On the other hand, it is notorious that the Milwaukee Street Railway company has a firm grip upon many of the aldermen, who will do its behests at all hazards. To a man up a tree it looks as though the McGann ordinance, if it ever does get through the Common Council, will be so burdened with conditions and restrictions that it will virtually be worthless. This result may hoodwink the people, and it will certainly please the old company.

William H. Bennett has been appointed receiver of the West Side Street Railway company, whose lines now form part of the Milwaukee Street Railway company's system. The appointment was made upon the petition of John Archer and A. Stephan, two judgment creditors, whose claims have not been satisfied, and the new receiver will have power to intervene in the United States court, where the receivers for the general system were appointed, and look after the interests of the creditors of the old company. He has already made a demand for the books of the West Side Railway company. Judge Johnson of the state Circuit Court has not yet appointed a receiver for the general company. Herman Block, a judgment creditor, has asked him to do so, and the matter is under advisement. Block, like Archer and Stephan, got a judgment for personal injuries, and the claim has not been satisfied.

## Siemens & Halske Process for Producing Electrolytic Zinc.

Heretofore the electrolysis of zinc salts has not been carried on commercially, principally because the metal was precipitated in the form of spongy zinc, difficult of utilization, if the solution included the least alkaline or metallic impurity. This forming of zinc sponge may be prevented by violently agitating the solution, principally by means of compressed air currents which at the same time oxydize the impurities of the bath.

To accomplish this result the source of power $M$ (Fig. 1) actuates, besides the dynamo $G$, which furnishes the current through $C$ $C$ to the series baths $Z$ $Z$, a ventilating fan $R$, which delivers the air by the tubes $P$ $P$ and their branches, $P^1$ $P^2$, $P^1$ $P^2$ (Figs. 2 and 3) at the bottom of the cell frames at $H$ $H$, which hold the carbon anodes $E^1$ and the zinc anodes $E$, thus maintaining a circulation in the direction of the arrows. A current of 50 amperes per square meter, with cathodes of one meter long and 0.7 meter wide, requires for the best results a current of air of about 1.3 cubic meters per hour per cathode. With a bath containing a solution of zinc sulphate of 10° Baume density, and adding five to 10 grammes of sulphuric acid per liter, a deposit of perfectly solid, non-spongy zinc is obtained.

The zinc is deposited upon the cathodes and the oxygen is disengaged at the anodes. The volume of the bath remains nearly stationary. The acid must be added gradually and when the proper acidity of the bath has been accomplished, the cathodes should be properly cleaned before proceeding with the work. The cuts are taken from *L'Eclairage Electrique*.

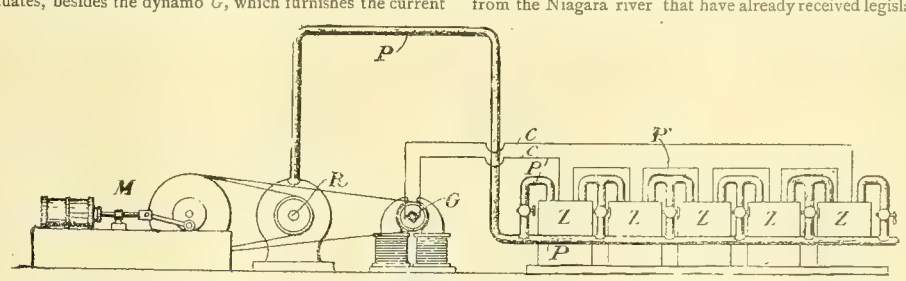

FIG. 1. SIEMENS & HALSKE PROCESS FOR PRODUCING ELECTROLYTIC ZINC.—ELECTRICAL AND PNEUMATIC CONNECTIONS.

## American Institute of Electrical Engineers.

At the monthly meeting of the council of the Institute, December 18th, the following named associate members were elected: Chas. F. Bancroft, Lowell, Mass.; Frank E. Herdman, Chicago; Richard Lamb, New York; Leon Le Pontois, Pittsburg, Pa.; Harry W. Ludlam, New York; Samuel G. McMeen, Chicago; Frank L. Scidmore, New York; Joseph P. Stone, Schenectady, N. Y.; Norman W. Storer, Pittsburg; Chester H. Thordarsson, Chicago; Harrison C. Wybro, Los Angeles, Cal.

The following named associate members were transferred to full membership: George Stephens, Peterboro, Ont.; George White-Fraser, Toronto, Ont.; Alex. Dow, Detroit, Mich.; Samuel G. Neiler, Chicago, Ill.; L. Knowles Perot, Phœnixville, Pa.; John Balch Blood, Schenectady, N. Y.; Franklin Sheble, Philadelphia, Pa.; William H. Freedman, New York; Andrew L. Riker, Brooklyn, N. Y.; John A. McCrossan, Rat Portage, Ont.

The following committee was appointed by President Duncan to consider the question of incorporation of the Institute and any revision of the constitution that might be necessary to comply therewith: W. B. Vansize, chairman; Prof. H. S. Carhart, W. F. C. Hasson, A. S. Hibbard, Dr. Cary T. Hutchinson, T. C. Martin, Townsend Wolcott.

## Brooklyn Street Lighting.

On Monday of last week the bids for lighting the streets and public buildings of Brooklyn by electricity during 1896 were opened. Singularly enough, the Municipal company, which covers the Eastern District, put in no bid. When called up on the telephone for an explanation, an official of the company said it had forgotten all about the matter, but would send in a bid later. The bidders were the Edison company, the Citizens' company and the Kings County Electric Light & Power company, the last named being the latest competitor in the field. It was the company's first bid. The bid of the Citizens' company was: For arc lights of 1,200 candle power, 35 cents a light a night. If 400 additional lights a night are needed, a reduction of 1 cent a light a night will be made. In the event of a reduction of the number of lights below those in use on December 31, 1895, the rate will be 40 cents. For lighting public buildings 2.2 cents per ampere per hour. The Edison company bid 35 cents for arc lights of 1,200 candle power and 17½ cents for 600 candle, all additional lights to be furnished for 20 cents a lamp a night. If the number is reduced, the rate will be 40 cents. The same company, for lighting public buildings, bid 0.8 cent per lamp hour for incandescent lamps of 16 candle power; 5 cents per lamp hour arc lights 1,200 power, 7 cents per lamp hour. The Kings County Electric Light & Power company offered arc lights of 1,200 candle power at 32 cents a lamp each night. This company's bid covers only Fulton street to Snediker avenue and Court street to First place. The company makes the same bid for streets on which it may hereafter have circuits as the department might designate.

## Diverting the Water of Niagara Falls.

The commissioners of the New York state reservation at Niagara Falls have steadily set their faces against schemes of those seeking to appropriate property of the state or get a foothold upon it for private, personal or money-making purposes. The great increase of projects to take water from the Niagara river that have already received legislative sanction, added to enterprises to utilize the more distant waters of the lakes, which waters are essential to the integrity of the Falls, has become the occasion of a general apprehension that the spectacle of the Falls is likely to be impaired. A recent report says that there are six power companies which now take water from the river above the Falls without compensation, and concludes: "In return for these immensely valuable franchises the state of New York has not received one cent of consideration. The state reservations at the Falls have cost the state of New York, in round numbers, $2,500,000. This reservation was founded and this immense sum has been expended to give the people of the whole world an opportunity to view at slight expense one of the grandest and most sublime scenes on the face of the globe, and if corporate and individual ambition is not checked and made subordinate to public rights, there is certainly danger that the Falls of Niagara, like the Falls of Minnehaha, will soon live in the tradition of song and story only, and will be sadly deficient in the amount of water flowing over their brink."

Western Electrician.

TELEPHONE, MAIN 1746.

EASTERN OFFICE: 108 TIMES BUILDING, NEW YORK.

Trade Supplied by Western News Co.

COPYRIGHT.—Not only the title but the *entire contents* of each number of the WESTERN ELECTRICIAN are copyrighted. This paper is entered at the Chicago Postoffice as mail matter of the second class.

SUBSCRIPTION, in advance, postage prepaid, $3.00 for a full year of 52 numbers; in clubs of four or more, $2.50 with free extra copy for eight subscriptions; foreign countries, $5.00 a year; single copies 10 cents. When change of address is requested, the old address as well as the new should be given.

CORRESPONDENCE relating to electricity or any of its practical applications, is cordially invited, and the co-operation of all electrical thinkers and workers earnestly desired. Clear, concise, well written articles are especially welcome; and communications, views, news items, local newspaper clippings, or any information likely to interest electricians, will be thankfully received and cheerfully acknowledged.

ADVERTISING.—THE WESTERN ELECTRICIAN **the only general electrical paper published in the West—** thoroughly covers a territory *exclusively its own*. THIS IS A CLAIM WHICH CAN BE MADE BY NO OTHER ELECTRICAL JOURNAL IN THE UNITED STATES. Electrical merchants and manufacturers *desiring western trade* will appreciate the UNEQUALED VALUE of this journal as an advertising medium in its special field. Advertising rates are moderate, and will be furnished on application.

JUST how the American electrical trade will be affected by the controversy between this country and Great Britain over the Venezuela dispute, is largely a matter of conjecture as yet, but it is to be hoped that any disturbance or interference in our trade relations with the South American state will be only temporary. There can be no doubt that the people of Venezuela prefer to trade with the United States, and it has been the policy of this government to cultivate that friendly feeling. As a result Venezuela has furnished an excellent market during the last year or two, and considerable electrical apparatus has been shipped there from this country. American construction companies have been favored there, too, and American workmen have done the greater part of the work of installation, thus far. There is promise of great development in that field, and it is to be hoped that this country will reap the advantage.

RECENT accidents on the Broadway cable line have again called attention to the subject of fenders. A former chairman of the Board of Railroad Commissioners of the state has written a letter to the present chairman of the board in which he asks "Why the present Board of Railroad Commissioners has not compelled the Broadway & Seventh Avenue Railroad company to equip its cars with 'a safety guard' in front of the wheels, in accordance with the seventh requirement of the board (as formerly constituted) imposed as a condition precedent to its approval of a change of motive power by the railroad company, as set forth in the official order of the board, dated July 31, 1890." It is not contended that there is a perfect safety fender, but the writer of the communication claims that the company has not taken advantage of the devices which are to be had to-day. Those which are now used, he says, are not of any practical value.

In Brooklyn and in other eastern cities the outcry against fenderless trolley-cars continues, despite the protestations of the companies that they are doing everything in reason to encourage those who are engaged upon the problem of perfecting a safety device that may be relied upon. It is to be regretted that there is occasion for these protests, but it seems impossible under existing conditions to avoid these accidents. No doubt carelessness on the part of the companies' employes and the public contributes largely to this state of affairs.

LATE advices from Milwaukee indicate that the Wisconsin Telephone company and its Milwaukee subscribers are in a fair way to arrive at a satisfactory settlement, the company making certain concessions which, in a measure at least, satisfy the demands of the subscribers. It is claimed, on behalf of the local company, that its net earnings have not exceeded 8 per cent. upon the investment and that it has not paid more than 6 per cent. per annum for several years. If this statement is made in good faith and if the company can satisfy the public of the justice of its plea, it will be a revelation to most people who are familiar with telephone properties in this country. The Wisconsin company has always been looked upon as a particularly favored corporation, occupying an advantageous field, and managed with care and good judgment, but if this statement gives a true indication of the condition of the company's affairs a revision of the opinion must be made. It is only reasonable to suppose that the gentlemen entrusted with the management of the company have administered its affairs carefully and intelligently, and on this ssumptioan it seems really remarkable that such a poor showing is made, provided there has been no juggling of accounts. Of course there are many systems of book-keeping, and the aim of some of them seems to be not to show the true condition of affairs, but when the statement is made that a company has not been able to show a net earning of more than 8 per cent. upon the actual investment devices of book-keeping are not to be considered. Are there any more Bell companies in the country similarly situated?

AS MIGHT have been expected, George J. Gould is opposed to municipal ownership of railways, telephones and telegraphs. The president of the Manhattan Elevated Railway company gave his views upon this subject before a legislative committee of inquiry recently. His views accord with those of other men who have had experience in the management of great public enterprises, as will be seen from the following extract from his testimony:

I do not believe in municipal ownership. I do not think it is a proper thing for the government to take up. It should be left to private capital. A government railroad is never run as carefully, financially or from a public standpoint, as one controlled by a private corporation. It doesn't pay in Europe, where it has been tried. The taxpayers pay. It is the same with the telegraph and the telephone. The postal telegraph in England has a deficit every year. Government ownership is a leaning toward socialism. Private capital should be left to develop these enterprises, and should take the risks. We tried government ownership, in a way, with the Pacific railroad, and it resulted disastrously for the government and the railroad too.

Whatever criticism may be made by those who differ with Mr. Gould, it will be generally admitted that his assertion that "a government railroad is never run as carefully, financially or from a public standpoint, as one controlled by a private corporation," is absolutely true. The same restriction applies to all enterprises conducted by municipalities. What better illustration could the people of Chicago desire than that furnished by the city lighting department? After much boasting and many absurd promises, the city electrician is compelled to admit that he has been unable to keep his promises, that he has failed utterly; and to-day the city has an elephant on its hands in Barrett's lighting scheme.

WHENEVER the daily papers chronicle the breakdown of the cable system, the suspension of traffic on the elevated roads or the blockade of the trolley lines, they invariably refer to the inconvenience to which the public is put by reason of these failures, which make it necessary to depend temporarily upon horse cars. It is certainly true that such accidents are aggravating, and it is also true that they annoy the railway companies just as much as they disappoint the public. Moreover, every such failure means a certain loss to the company, and anyone familiar with street railway matters will realize that these losses are by no means inconsiderable. If the public would bear these facts in mind, the street railway companies would not be charged with wanton disregard of the convenience of the public. But then it is possibly too much to expect a man to exercise common sense when he is delayed in getting home to dinner or a tempting to catch a train.

But there is one feature of these accidents which does not seem to impress the public, that is the fact that the improved service has created a demand for better transportation facilities than were formerly enjoyed. What are considered necessities to-day were only a few years ago beyond the command of the traveling public; the transportation companies could not at that time furnish such service, and the public was not educated up to an appreciation of it. Times have changed, and the people who a few years ago contentedly jogged along in horse cars, now grumble at a five minutes' delay on a cable, trolley or elevated line.

DESPITE the rabid opposition of a large portion of the daily press of Chicago and certain electro-political agitators, the business community is very generally in favor of the extension of the overhead trolley electric railway service in all but the busiest streets in the central business district. It is unquestionably true that a well managed trolley line, with regular, frequent car service, is of great advantage to the outlying avenues of trade, and the fact is very generally recognized. The recent action of the West Madison Street Business Men's association is a late confirmation of this truth. This street is the principal business artery of the great West Side. It has a cable railway at present, but the business men are not satisfied, and hope to see the existing service supplemented by a trolley line running directly to the heart of the city over the Madison street bridge. The present main effort of the association is to get West Madison street, from Jefferson to Center avenue, thoroughly cleaned. Substantial progress has been made in the matter of street improvement, but there are other matters which will be taken up in due time, and the trolley question is one of them. On Wednesday of last week a meeting of the association was held, and John M. Smyth, a prominent merchant, pointed out that the association had other objects than street cleaning. It was organized to promote and develop the best interests of West Madison street in every way. The interests of that street were the interests of the whole West Division. The best possible transportation facilities were needed, and he suggested a trolley line. Mr. Smyth moved the appointment of a committee of five to consider the trolley question with relation to the further development of West Madison street, with power to act for the association, and having behind it the pledged and united strength of the business men interested. His motion was adopted by acclamation.

In itself the trolley is all right. In the existing stage of development of surface transportation in American cities it is a necessity. Aside from the esthetic objection, the opposition to it can almost always be traced to ignorant prejudice or the clamor of commercial rivalry.

WILL the present Congress take up the subject of establishing a Pacific cable connecting this country with Hawaii? In the last Congress a bill was introduced and passed by the Senate, authorizing the President to contract for a cable to the Hawaiian Islands at a cost not to exceed $3,000,000. The bill was bitterly opposed by the administration and failed in the House. The plea was made by opponents of the measure that a corporation would be a better agency for securing a cable, because for commercial and general purposes government ownership and general management are not desirable. Now there is promise that the matter will again be brought up and in a form that will meet the objections raised to last year's measure. A private company has been formed in New Jersey by New York capitalists, headed by Abram S. Hewitt, to co-operate with Col. Z. S. Spaulding, who is the projector of the enterprise. Business men of New York who recognize the importance of the undertaking, are lending much encouragement to the project. Mr. Hewitt, who seems to be deeply interested in the movement, outlined the policy of the company in an interview which is reprinted on another page. He says that Col. Spaulding's idea is to apply to the government of the United States for a sufficient subsidy to warrant the laying of the cable and for its maintenance. Mr. Hewitt and his associates have agreed to co-operate with Col. Spaulding and to furnish the money required, provided the subsidy is secured. The scheme is not a money-making enterprise, and hence, in the bill which will be presented to Congress, provision is made that the United States Government may at any time release itself from the subsidy by taking the cable from the company at the actual cost of construction. The projectors of this enterprise say that they hope to secure to the United States the advantages of cable communication with the Hawaiian Islands, in the hope that the cable at some future time may be extended to Australia and China, with which countries we have large and growing commercial relations. The government of Hawaii, it will be remembered, has already granted a subsidy of $40,000 per year

## Underwriters' National Electric Association.

A meeting of the electrical committee of the Underwriters' National Electric association was held at the rooms of the National Board of Fire Underwriters in New York Tuesday, Wednesday and Thursday, December 10th, 11th and 12th. There were present at the meeting the following named members of the electrical committee: F. E. Cabot, superintendent of the construction and electrical department of the Boston Board of Fire Underwriters; C. M. Goddard, secretary of the New England Insurance Exchange; William McDevitt, inspector, Philadelphia Fire Underwriters' association; E. A. Fitzgerald, inspector, Underwriters' Association of New York State; W. H. Merrill, Jr., electrician, Chicago Fire Underwriters' association; A. E. Braddell, inment; A. M. Schoen, electrician, Southeastern Tariff association; W. A. Anderson, superintendent survey department, spector, Underwriters' association of the Middle Department, New York Board of Fire Underwriters.

Owing to the importance of the meeting, invitations had been extended to many members of the association not members of the committee. The following named gentlemen responded:

President Nichols of the National of Hartford; Vice-president Washburn of the Home of New York; Assistant Secretary Lowe of the L. & L. & G. of Atlanta; G. B. Lauder, inspector, New Hampshire Board of Underwriters; J. E. Cole, inspector, Boston Wire Department; G. W. Wilson, inspector, Boston Fire Underwriters' Union; E. V. French, inspector, Factory Mutual Fire Insurance companies; Ralph Sweetland and J. Couillard, inspectors, New England Insurance Exchange; J. C. Forsyth, inspector, New York Board of Fire Underwriters; Frank Kitton, inspector, Buffalo Association of Fire Underwriters; H. H. Hornsby, chief inspector, city of Chicago; G. F. Bottom, inspector, Kansas City Fire Underwriters' association, and M. L. Stern, city electrician, Denver, Colorado.

At this meeting the discussions and votes were not confined to the members of the electrical committee, but the full privileges of both discussion and voting were extended to all present.

Chairman Cabot opened the meeting with a short address, the recommendations in which were referred to a special committee, and on its report the following resolutions were adopted:

*Resolved*, That any increase of voltage on interior incandescent lighting circuits would result in a corresponding increase of danger to life and property, and that owing to the tendency toward the introduction of high voltages it be urged that extreme care be taken by inspectors and others in charge of such installations, without which we believe serious hazards may be incurred.

*Resolved*, That the members of this committee and other electrical inspectors here present pledge ourselves to exert our influence to further the enforcement of the rules and requirements of the National Board of Fire Underwriters, and to co-operate with the electrical bureau of said board in furnishing that bureau with facts which come under our observation regarding devices and materials which may not be constructed in accordance with these rules and the introduction of which would create a hazard to property.

*Resolved*, That we further agree that all bureau reports received setting forth such facts shall receive careful consideration and the findings of the report be followed out as far as possible in our respective territories, to the end that cooperative work along these lines may be established and uniformity of action in all essential matters secured.

*Resolved*, That the introduction of trolley wires in municipal districts is inimical to the safety of the property of the inhabitants of such districts, and that because of this fact all possible precautions should be taken by the managers of trolley roads throughout the country, to insure cutting the current off of the wires in case of fire in abutting property; also that trolley wires should be effectually protected against the possibility of contact between them and other conductors; also that trolley systems should be so arranged that practically no difference of potential, due to the effects of trolley roads, should exist between subterranean pipes.

A committee consisting of Messrs. French, Goddard and Sweetland was appointed to consider and report on the question of how best to guard against the hazard due to the possibility of the breaking down of the insulation between the primary and secondary transformer coils. This subject was considered important, especially in view of the tendency toward extremely high voltages in long-distance transmission.

The matter of preparing rules to govern marine wiring was referred to Mr. Sweetland for report.

The subject of protectors which should obviate the hazard due to the liability of wires, such as telegraph, telephone and similar signal wires, becoming crossed with electric light or power wires, was referred to a committee consisting of Messrs. Cabot, French and Merrill. This committee will report at a later date.

The secretary was instructed to submit his proof of the revised rules, as taken from the minutes, to the different members of the committee before sending to the printer. He was also instructed, in accordance with suggestions made by several members, that in compiling the rules the definitions be incorporated in the rules themselves instead of printed as an appendix. It was voted that the secretary advise all persons who sent in suggestions which were not adopted of the reasons given by the members of the committee for their rejection.

The changes made in the rules, while they were considerable in number, were very few of them radical, and the general class of work which now receives the approval of the underwriters under the present rules will not be greatly affected. It seemed to be the general opinion of those present that the rules were working satisfactorily both to the insurance and electrical interests, and that only such changes should be made as were necessary on account of the progress of the electrical industry itself, or where experience had shown that additions to the present rules were required. The following are some of the more important changes made, and are given in the order of the sections amended in the present rules:

The grounding of the frames of generators may be allowed when necessary by written permission, this change being made on account of the introduction of direct-connected and extremely large and heavy machines.

Switches for motors must hereafter plainly indicate whether the current is "on" or "off."

Rules were adopted requiring wires to be protected from mechanical injury in buildings when necessary; high potential wires by substantial boxing giving a reasonable air space, and low tension wires either by boxing or by an approved iron armored conduit tubing.

It was decided that the mesh of wire netting for arc light globes should not exceed 1¼ inches.

Switches on hanger boards must cut out both poles of the lamp.

The use of wire smaller than No. 14 B. & S. will not hereafter be allowed except for pendant and fixture work.

The rules as to the construction and painting or "filling" of moulding were made more explicit.

The rules for special wiring in breweries, etc., will require that joints and splices be avoided as far as possible, and that switches in damp places be mounted on porcelain knobs so as to give an air space behind them.

It will hereafter be allowable to draw strings into conduits for the purpose of pulling in the conductors, which should not be placed in the conduit until the mechanical work on the building has been completed as far as possible.

Hereafter cut-outs will not be allowed in the canopies or shells of fixtures.

Circuits must be arranged so that no group of lamps (whether on the same fixture or not) requiring a current of more than six amperes will be allowed to be ultimately dependent upon one cut-out, except that special permission may be given in writing for departure from this rule in case of large chandeliers.

Steps were taken which will tend to improve the character of double conductors, and hereafter, except for pendants and fixture work, a solid rubber insulation, protected by durable braid, will be required for flexible conductors.

Supports for motor ceiling fans must have an insulator interposed between them and the motor.

The electrical requirements of the standard for car barns and repair shops as contained in the schedule now used by a number of rating organizations are now to be incorporated in the rules.

Service switches must disconnect all of the wires entering the building; that is, on the three-wire system all three wires must be opened by operating the switch.

The use of brass sheathed interior conduit and vulca tubing will not hereafter be approved for bushings.

The use of incandescent lamps in series circuits for decorative purposes will be allowed by special written permission when installed in a proper manner.

Rules for electric heating apparatus were adopted which will require, in addition to the general wiring being done in accordance with rules, that the switches shall plainly indicate whether the current is on or off; that the attachment of the feed wires be in plain sight; that stationary heaters be treated as stoves, and that the flexible conductor necessary for use with flat-irons and other devices of a similar nature shall have an insulation that will not be injured by heat, such as asbestos, which insulation must be protected from mechanical injury by a substantial outer braiding.

The suggestion that the table of safe carrying capacity for wires was too near the actual limit of safety was referred to the chairman of the committee for tests, investigation and reports.

The matter of obtaining more effective and more efficiently constructed devices for automatic safety cut-outs, was referred to the committee on tests, with the request that it obtain all the information possible in relation to the proper construction of fuse blocks, length of fuses and efficiency of fuse metal, in connection with currents of varying quantity and potential.

The attention of the committee was called to the fact that it was claimed by storage battery experts that these batteries were extremely subject to damage by water in case of fire.

The committee on tests was requested to report a standard for iron or steel armored conduit which should meet the approval of the committee.

A communication from Edward H. Johnson of the Interior Conduit & Insulation company, setting forth the merits of that class of wiring, especially that of the iron armored conduit, and suggesting that insurance companies should encourage this class of construction by a reduction in the premium on risks so wired, was read and placed on file.

As the work of the electrical committee of this association has now become generally recognized throughout the United States by the boards of fire underwriters which have adopted the rules recommended by the committee, and as quite a number of cities have also incorporated these rules in their city ordinances regulating the introduction and maintenance of electric light and power wiring a brief sketch of the formation of the association and the work which has been accomplished by the association and its electrical committee has been prepared by the secretary, and is herewith appended:

In the summer of 1892 the secretary of the New England Insurance Exchange, after correspondence with the electrical inspectors of the underwriters' associations in the East, called a meeting of the electrical representatives of the eastern associations for August 18th at the rooms of the National Board in New York. This meeting was called without any especially prepared plan of action, and it was not felt advisable to ask for representatives from boards situated at a distance from New York city. The meeting, however, was more of a success than had even been hoped for. The rules as adopted by the National Electric Light association were taken as a basis, and were carefully considered and revised, section by section. Proofs of the revised rules were sent to all the underwriters' organizations in the United States, with notice that a second meeting would be held in New York city, and with the request that any suggestions in relation to the rules be sent to the chairman of the meeting. These organizations were also advised that a plan for a permanent organization of the electrical representatives of the underwriters would be presented at the meeting, and all were requested to send representatives to that meeting, which was held on December 6th of the same year.

At the December meeting a permanent organization was formed called the Underwriters' International Electric association, but at a later date the name was changed to the Underwriters' National Electric association.

The articles of association, which have only been slightly changed since their adoption at that meeting, provide "that any member, officer or employe of any fire underwriters' organization or fire insurance company in the United States or Canada may become a member of the association on application to the secretary." The officers of the association are a president, vice-president and secretary and treasurer. The articles of association also provide for an executive committee and an electrical committee, the latter to consist of nine members who shall be chosen from the electrical experts employed by the insurance interests. The officers are also ex-officio members of the electrical committee. All meetings of the association must be held at the National Board rooms in New York city. The officers and electrical committee, which have remained unchanged since the organization of the association, are as follows:

President—C. E. Bliven of Chicago.
Vice-president—W. A. Anderson of New York.
Secretary and treasurer—C. M. Goddard of Boston.
Electrical committee—F. E. Cabot of Boston, chairman; William McDevitt of Philadelphia; George P. Low of San Francisco; A. E. Van Geisen of New York; E. A. Fitzgerald of Syracuse; Edward Leloup of New Orleans; W. H. Merrill, Jr., of Chicago; A. M. Schoen of Atlanta, and A. E. Braddell of Philadelphia.

The rules formulated at the August meeting were again carefully gone over and amended as seemed necessary, after which every person present agreed to recommend to his association that they be adopted as the standard for the territory under its jurisdiction.

The next meeting of the electrical committee was held on August 17, 1893, in Chicago, and an adjourned meeting was held on September 5th, in Boston. As the rules adopted at the meeting in 1892 had then been in use by most of the principal underwriters' associations for nearly a year, the committee had the advantage of suggestions and criticisms drawn from the actual application of these rules, and they were again carefully taken up, section by section, and such changes and additions as experience seemed to indicate to be desirable were adopted.

At this meeting, also, the word "approved," which was frequently used in the first edition of the rules to describe wires and devices, was defined, and these definitions were incorporated in the rules themselves. A list of wires which had been found to comply with the requirements of the rules was also published and a resolution was adopted calling attention to the liability of the destruction of metallic substances, especially water and gas mains, buried in the ground, by electrolysis due to the ground return of single trolley street railway systems. This resolution was sent to the various boards of underwriters to call their attention to a matter which was of practically very recent development, and correspondence was invited on the subject.

The work of Mr. Merrill in Chicago in connection with the electrical committee is worthy of special notice. Starting first with the idea of collecting and distributing as full information as possible in regard to fires due to electricity,

he has gradually established a department which is of great assistance not only to the electrical inspectors of the country, but also to the insurance companies and their various field representatives. His fire reports on behalf of the committee have become well known and have no doubt had the tendency to lessen the number of electrical fires by calling the attention of the various inspectors to the probable causes which may develop an electrical hazard, as shown not simply in the experience of one man or in one particular section, but in the experience of many inspectors covering nearly the whole territory of the United States.

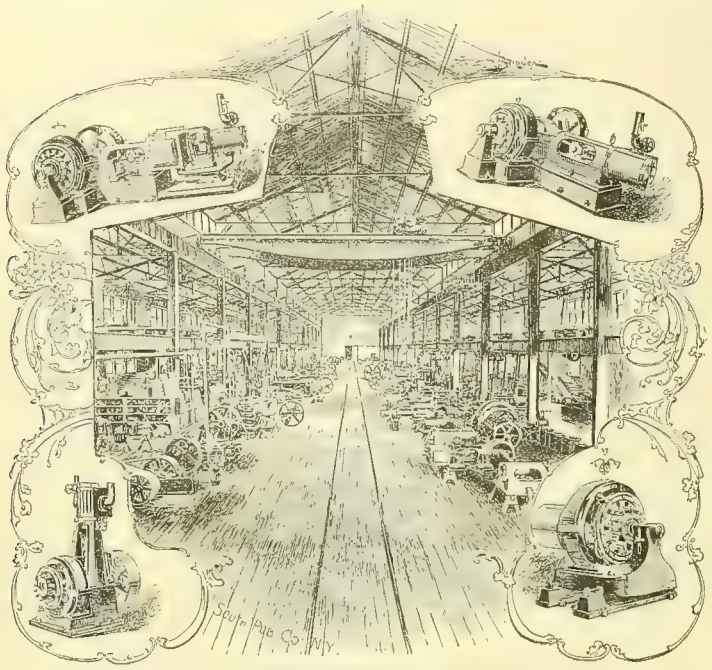

FIG 1. DETAILS OF M'EWEN ENGINE AND THOMPSON-RYAN DYNAMO.

Further than this, he has established a testing bureau and a system of distributing reports of the results of the tests there made, so that every inspector has the advantage of the experience and knowledge developed by a fully equipped and well managed testing laboratory. These reports have been of inestimable value in ridding the market of cheap and poorly constructed material and devices. The reputable manufacturers, being glad to remedy any defects shown in these reports, have improved their devices, and the goods of other less reputable parties have been to some extent driven from the market. It is the duty of every insurance inspector, and it is hoped that it will be the pleasure of all connected with the electrical interests, to furnish Mr. Merrill with as full data as possible relating to electrical fires and devices and materials which may come to their attention.

The next meeting of the electrical committee was held in New York on December 19, 1894. The changes in the rules made at this meeting were very few, but quite a large number of general subjects were taken up and considered and referred to special sub-committees. The most important action taken at this meeting, however, was the adoption, with the sanction of the committee on lighting of the National Board, of a resolution that the members present at the meeting would urge upon their respective associations an agreement to adopt and use the rules for safe wiring as adopted by the National Board of Fire Underwriters on the recommendation of the electrical committee, and that these rules should be printed only by the National Board, and that no changes or additions should be made except as promulgated through the National Board. The adoption of this resolution and the acceptance of the plan proposed by practically all of the underwriters' associations of the United States, at last brought about the result which was chiefly in the mind of the secretary of the New England Insurance Exchange when the first meeting was called, that is, an absolutely uniform set of rules for electric light and power wiring throughout the United States. That this result has been accomplished is shown by the fact that 40 underwriters' associations have ordered copies of these rules, all printed from the same type.

The electrical committee, feeling that the adoption of the rules recommended by it by the National Board and nearly all of the underwriters' organizations and their incorporation in the ordinances of some twelve or fifteen cities, had established the fact that their work had proved itself, so far as these rules were concerned, to be practical and satisfactory as a whole, considered that it was now in a position to invite general criticism from all those engaged in the electrical business. The rules had previously been submitted to and approved by representatives of the most prominent electrical manufacturers and central station men.

Early in October, 1895, the committee sent out a circular letter with blanks, practically broadcast, inviting such suggestions for changes or additions in the present rules as could be made and supported by what to the person making them seemed to be good and logical arguments for their adoption, with a statement that these suggestions would recieve careful consideration at the meeting in December. A very large number of suggestions were received, and these formed the subject of the discussion at the committee meeting in New York, which has already been reported. The successful conclusion of the committee meeting greatly encourages those interested in this subject, and it is predicted that the results of the organization's work will be of lasting benefit to all concerned.

## Details of McEwen Engine and Thompson-Ryan Dynamo.

During the year now closing the J. H. McEwen Manufacturing company of 26 Cortlandt street, New York, the well-known builder of automatic engines, has entered the electrical field and is now building dynamo-electric machinery in connection with its engine business. This departure was announced in the WESTERN ELECTRICIAN some time ago, and a description of the first electrical machinery installed by the company—the plant in the Rothschild department store, Chicago—was published in the issue of May 25, 1895. In the present article it is proposed to exhibit details of construction of both engine and dynamo.

The McEwen high-speed engines have been in the market about four years, and have gained an enviable reputation as high-grade engines. The company claims that for direct-connected apparatus much better results can be obtained when both engine and dynamo are built by the same company, assembled and thoroughly tested before leaving the works. Then again, all parts can be standardized and made duplicate, and can be turned out at less cost than it is possible when the engine is built by one company and the dynamo by another in widely different localities. The complete machine, having been thoroughly tested at the works, insures quick and satisfactory starting when it reaches its destination. This feature will be appreciated by those who have had experience in this line.

The company has a large and modern plant well equipped with special tools, electric traveling and hydraulic jib cranes, hydraulic lifts, etc.

Railroad sidings extend through the center of the main building, so that all heavy material, etc., is handled by power cranes. The facilities are such that first-class work can be turned out at a reasonable cost.

Fig. 1 shows an interior view of the machine shop, a steel structure built by the Shiffler Bridge company, Pittsburg, Pa. The central part, 60 feet wide, is spanned by a 20 ton electric traveling crane, having 30 feet clear head room and runs the entire length of the room, which is 260 feet. Within this area all the heavy machines are located. On either side is a wing 30 by 260 feet long, the second floors or galleries of which are equipped with light tools, vise benches, etc.

This company has made some recent improvements in the details of its engines, notably in the governor and cross-head. Fig. 2 is a cut of the governor, which is extremely simple, having but one bearing, and that a roller pin bearing, which requires no lubrication, so that the want of lubrication will not affect its regulation, and as the spring is the only part that is adjustable there cannot be any trouble from misadjustment. The engine must regulate nicely, as the builders state that they have given the following guarantee with every engine that they have sold, and have in no case failed to meet it:

The engine shall not run one revolution slower when fully loaded than when running empty, and a reduction of boiler pressure from the greatest to that necessary to do the work will not reduce the speed of the engine one revolution. Any engine failing to meet this guarantee becomes the property of the purchaser upon payment of one dollar.

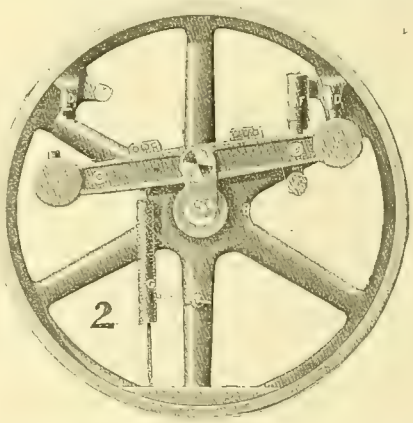
Figs. 3 and 4 show the construction of the cross-head. The shoes are held in position by eccentric bolts. To adjust position of shoes for wear, it is only necessary to loosen nut and turn the eccentric bolt to such an extent as is necessary to give proper adjustment. Then tighten nut, and it will remain in that position. It will be noticed that shoes swivel on the eccentric bolts, so that it is impossible for shoes to have anything but a full bearing. Both upper and lower guides, as well as cross-head pin, are oiled from stationary sight-feed oil cup on top of frame. The oil is wiped off by upper shoe, and is caught in oil groove shown, extending across the face of shoe, and led through oil holes at each end of grooves to inside of upper shoe; thence to a funnel-shaped oil hole in strap of cross-head box to cross-head pin; from there it drops to lower shoe and then through holes in this shoe to lower guide.

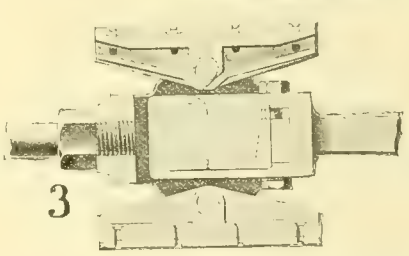
The shoes are faced with genuine babbitt, which is put on in such a manner that it is as solid as though it was part of the shoe itself.

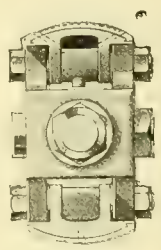
The Thompson-Ryan dynamo represents a radical departure from the beaten tracks of dynamo design, differing in nearly every detail of construction from the ordinary type of machine. The most important feature is a set of series windings surrounding the armature, and termed balancing coils. This feature, which is the invention of Prof. Harris J. Ryan of Cornell University, was introduced for the purpose of balancing armature reaction, and carefully conducted scientific tests show that it accomplishes the desired end perfectly. Having no armature reaction to contend with, the designers of the Thompson-Ryan dynamo have been able to introduce into their designs many important features never before possible.

At first thought it would seem that the addition of balancing coils to a dynamo would complicate the construction to a certain extent, and so it would if applied to the ordinary type. But all this is fully offset by the simplification of the machine in other respects. The field castings of these machines are of steel and consist of but three pieces, which are held together by four bolts. One of these castings is the "pole-ring," shown in Fig. 5, through which the balancing coils are wound; and the other two constitute the field ring proper, Fig. 7.

The balancing coils are wound in such a way that the current passes through them across the pole face in the opposite direction from the currents in the armature conductors, and thus the magnetic effects of the armature currents are neutralized.

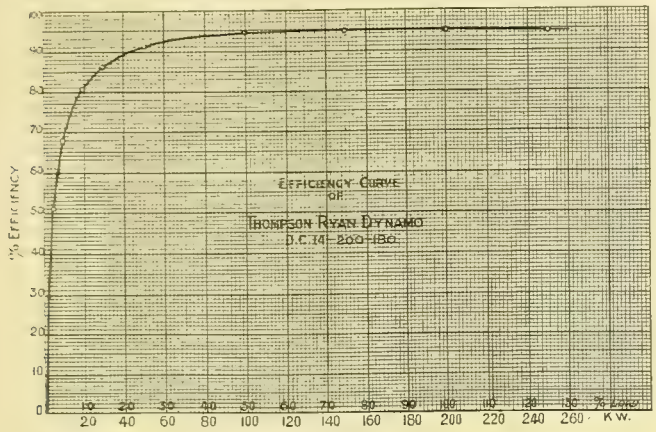


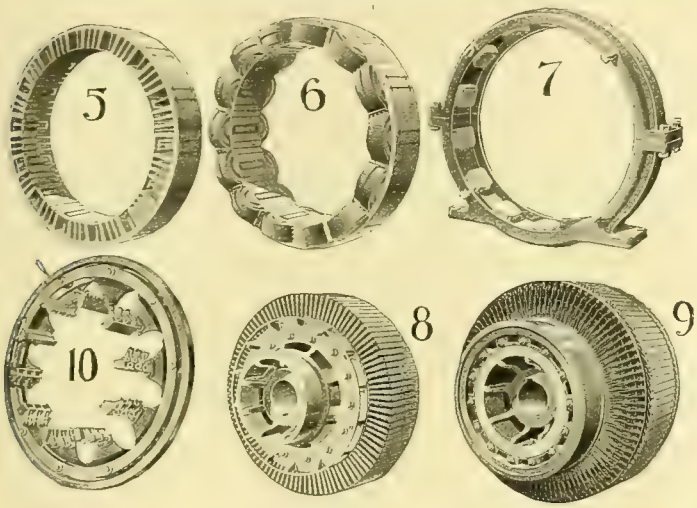




FIGS. 2, 3 AND 4. DETAILS OF M'EWEN ENGINE AND THOMPSON-RYAN DYNAMO.

Fig. 6 is a view of the completed pole ring. The field ring, Fig. 7, shows on its internal periphery the "pole necks," around which the coils are placed. It will be seen that the field ring is of such a shape as to entirely enclose the field coils, thus thoroughly protecting them from mechanical injury. It will be noted also that the space in the field ring allowed for the field coils is unusually small. This arises from the fact that less than one-fourth as much energy is required to magnetize the fields of this dynamo as is necessary for a machine of equal capacity of ordinary design. On account of the very small amount of field energy required the rise in temperature of the field coils is very slight, notwithstanding the fact that these coils are so nearly surrounded on all sides. No compound winding is used on these dynamos, since the balancing coils afford a compounding vastly more effective than the compound coils of the ordinary dynamo.





FIGS. 5 TO 11. DETAILS OF M'EWEN ENGINE AND THOMPSON-RYAN DYNAMO.

All of the armatures for the Thompson-Ryan dynamos, of whatever capacity and whether wire wound or bar wound, are constructed on the same general style. The cores are built of thin plates of a peculiar special steel, the distinctive feature of which is its unusually low hysteresis loss. The plates are stamped out in the form of rings, and a series of long slots are punched near the edges. These rings are then clamped firmly to a central hub or spider by means of brass end plates. There are no bolts passing through the laminated core, and no iron comes in contact with these plates. As a consequence of this there is no leakage of magnetism and no development of potential in any part of the core to cause eddy currents and waste energy. The holes in the plates form "tunnels" in which the armature windings are placed. Fig. 8 gives a very good idea of the appearance of the finished armature core.

It will be noted that the slots or tunnels are of unusual depth for this style of armature and, in the particular core illustrated, the depth of copper to be placed in each slot is at least three times as much as is used by most builders for an armature of similar size.

Another peculiarity of this machine is the large number of poles used. This feature, which in ordinary designs would be bad practice, is a valuable one of this peculiar style of design, enabling the builders to greatly shorten their armature conductors, and to use on all their armatures what may be described as the cylindro-hexagonal style of drum winding. In this winding all parts of every conductor of any particular layer on the armature lie in the same cylindrical surface, and the windings do not bend down over the end of the armature core at any point, and the conductors being placed through the core and below the surface, no binding wire is necessary.

The commutators of all of these machines are built of tempered copper, with pure mica insulation throughout.

They are carefully and solidly built, and, as a rule, are large in diameter and comparatively short in length. They are not mounted on the shaft, as is the usual practice, but are carried by a projecting ring of the spider. Fig. 9 is a view of the completed armature for a 200 kilowatt direct-connected railway generator.

One of the most important and noticeable features of these armatures is the ventilation. The armature being large in diameter, the central opening is also large and extends entirely through the armature from end to end, thus affording large heat radiating surface. The principal ventilation is effected by the winding itself. The conductors cross one another in such a way as to form a sort of open lattice work with innumerable radial openings through which the air circulates in great quantities.

But little heat is developed in the core of the armatures, since the quantity of iron is comparatively small and the magnetic density low, and the armature being short and the ends of the windings so thoroughly cooled, it will be readily seen that there is small danger of over-heating one of these armatures, even with excessive loads.

Fig. 10 is a view of complete brush-holder arrangement. The brush-holders project outward and leave the entire outer end of the commutator free and accessible.

The only leads employed on the whole machine are one from the negative brush holder ring to the negative terminal, and another from the positive brush-holder ring to the inner end of the balancing coils.

The brush holders themselves are very simple, and hold the brushes in such a way that they require no adjustment, but have only to be slipped into the holder. Working with brush holders absolutely fixed, there is entire freedom from sparking under any and all conditions of load.

The whole brush-holder arrangement is adjustable around the commutator, and by loosening the clamp bolts the brushes may be shifted backward or forward. This is only done, however, for the purpose of adjusting the compounding of the machine. By shifting the brushes in this way the machines may be adjusted through a range of from 10 per cent. drop at full load to 10 per cent. rise, and this without any effect whatever on the commutation.

Fig. 11 shows a curve of commercial efficiency taken from actual tests of a Thompson-Ryan 200 kilowatt railway generator. The peculiar features of this curve are not so much the good efficiency under heavy load as the unusually high efficiency under light loads and the very great range of uniform efficiency. This is due to the unusually small fixed losses, the result of the very small field energy consumed and the light core losses.

Another important feature of this dynamo is the great ease with which two or more machines may be worked in parallel. The design of the machine peculiarly fits it for this sort of service. They may be thrown in parallel while differing widely in voltage produced, and each machine will take its due proportion of the load, notwithstanding the fact that they may be greatly over compounded. Two or more of these machines will work perfectly in parallel, and divide the lightest load evenly or maintain perfect unison with the entire load thrown off.

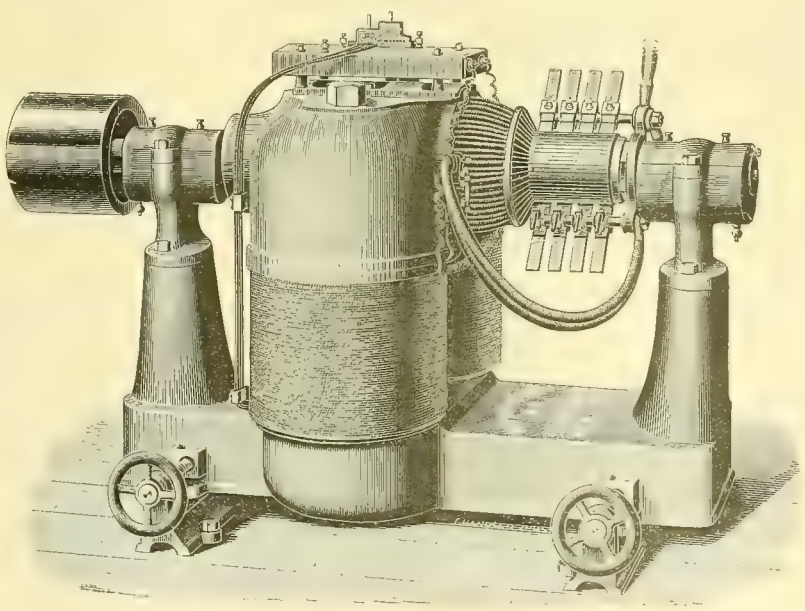
The Thompson-Ryan dynamos are built in sizes from 12½ kilowatts to 1,500 kilowatts capacity, both belted and direct-connected. Fig. 1 shows the belted dynamo as well as the dynamo direct-connected to the different types of the McEwen engines.

The manufacturers state they will be pleased to furnish handsomely illustrated catalogues of either their engine or dynamo to those who request them.

## Kester Dynamos and Motors.

The Kester dynamos and motors have become well known, and have very satisfactorily proved their efficiency in 37 states of the Union. The mechanical and electrical construction is excellent. Some of the special features of these machines are strong construction, low center of gravity and perfect balance of armature (insuring freedom from vibration, with minimum wear). The journals are supported by universal ball joints, thus obtaining perfect alignment. The cut represents the upright bipolar 110 volt 37 kilowatt dynamo designed for belt driving at moderate speed. The commutator has a much larger brush surface for the same current than is usually allowed. The armatures in the larger machines are wound in such a manner as to eliminate eddy currents, thus allowing the machines to stand considerable overload. The machines are so compounded, that after brushes are once set there will be no sparking, though the load be changed from nothing to full load.

The motors are similar in design to the incandescent dynamo, and in their construction have the same essential features, with the exception of carbon brushes. These motors are highly efficient and speed moderate, and the amount of power required to operate them is comparatively small in proportion to the work being done. They operate quietly and require but slight attention.

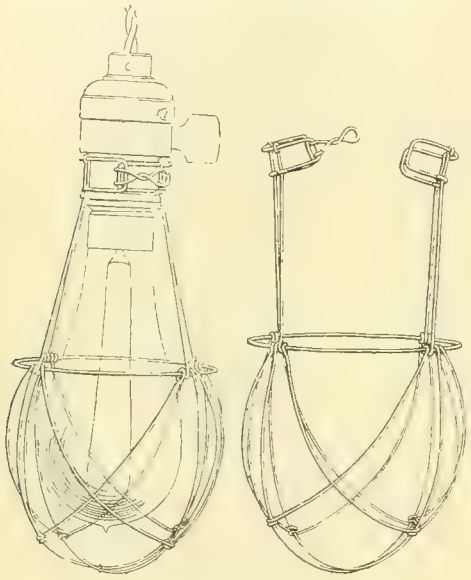


KESTER DYNAMOS AND MOTORS.

The manufacturer of this machine, the Kester Electric company of Terre Haute, Indiana, has within the last year made numerous special applications, in which the advantages of its machines have been clearly shown—such as rock crushers, rock drills, coal cutters, pumping and hoisting machines. The Chicago agency has recently been placed with Richards & Meacham, 84 and 86 La Salle street.

## Incandescent Lamp Guard.

To protect incandescent lamps from external harm a guard of some kind is often required. An excellent device of this nature is the "Perfection" lamp guard manufactured by William Inglis of Detroit, Mich., and shown in Figs. 1 and 2. One of the principal merits of the guard lies in the provision for fastening it. It is made to fit the socket very snugly, and the hasp or lock being put through the opposite loop and lapped over, as shown in Fig. 1, draws all the wires around the socket in the tightest possible manner and holds the guard upon the socket rigidly, thus protecting the lamp when put to the most severe usage. The fastening being made in the nature of a hinge, the guard can be easily taken off and replaced without bending the wires out of shape, which is so apt to occur with the guards made with slides. The "Perfection" guard, which is made to fit all styles of sockets, is of bright tinned wire, silver finish, and is exceedingly neat in appearance.



FIGS. 1 AND 2. INCANDESCENT LAMP GUARD.

## The Real and the Unreal Business Paper.

By N. C. Fowler, Jr.

Imitation is the order of the day. Imitators are everywhere. The real and the unreal live side by side. The good and the bad are neighbors. There are trade papers which are trade papers. There are trade papers which trade on the trade, and have nothing to trade with. The profitable trade paper is very profitable. First-class trade papers make money. All first-class men are successful. All honest men succeed. Dishonest men try to, and sometimes do.

There are papers masquerading under the names of legitimate publications which are nothing more nor less than advertisements bound together in pamphlet form. There are so-called trade papers which have no circulation, and which cannot get any circulation. There are trade papers run by men who know nothing about the trade they represent.

The popular impression that all trade papers are successful has thrown upon the market numerous illegitimate publications which attempt to float on the water which has passed, and to sail by the wind of others.

A trade paper can be three-quarters advertising, and yet be a good trade paper. A trade paper can be half clippings and yet be a real trade paper. The trade paper which is a trade paper is the paper which contains part advertising, part original matter, part clippings, and is of interest and benefit to its readers, and such a trade paper is obliged to have circulation. There is many a trade paper with half its circulation in the form of sample copies, but that does not seriously handicap its advertising value, for each sample copy is sent out as a means to obtain a new subscriber, and each sample copy reaches people of its trade, because it would not pay to send sample copies to folks of any other class.

The trade paper which is all sample copies is illegitimate—it has no right of existence. The trade paper which is all clippings is not a real publication. The trade paper which is all advertising cannot be classed in the first class. The trade paper which contains nothing but puffs is not worthy of consideration. The trade paper which has all of its reading columns for sale, and which sells nearly all of its reading matter space, is worthless as an advertising medium.

The trade paper has a perfect right to print a paid notice. Every publication, excepting a few of the magazines, do that. The trade paper can legitimately speak well of its advertisers—it ought to do that—the advertisers expect it. The trade paper which speaks illy of those who do not advertise in its columns is a trade paper which has no standing, and which is worth little. There are trade papers in the country which are nothing more nor less than blackmailing sheets, which the government ought not to transmit through the mails, and which are a detriment to the trade they represent, and to the honesty of the craft.

The legitimate trade paper, the trade paper of character, and the trade paper which pays the advertiser, is the trade paper which carries a large amount of advertising, for such advertising is as valuable to the reader as the reading columns themselves, for these pages of advertisements present pictures of progress, and tell the buyers what to buy as well as where to buy.

The legitimate trade paper contains a reasonable amount of reading matter, part of it original, and part of it copied. The legitimate trade paper balances its advertising with its reading matter, and its reading matter with its advertising. It prints legitimate reading notices. It speaks well of its advertisers, but it is not a paper of puffs—it is a paper of news and comment, simply the right combination of all that which makes up a first-class publication.

Beware of the trade paper which has a different rate for every advertiser. Look out for the trade paper which has a "Seeing it's you" concession for everybody. Look out for the trade paper which does not stand on its own dignity and say to the advertiser, "My space is merchandise. If you want it, you must buy it as you buy your clothes or your shoes." Look out for the trade paper that puffs everybody indiscriminately.

The trade paper can be known by the quality of its representatives. First-class advertising men work for first-class papers. Second-class advertising men work for second-class papers. The representative of the legitimate trade paper is a gentleman—a man worthy of your confidence. When he calls he is entitled to your consideration, and should be given an audience.

It is your business to discourage the illegitimate trade paper.

It is your business to encourage, with your money and your interest, the trade paper of character, for such a paper is as much a part of your business, and is as necessary to your business, as your desks and your counters.

# CORRESPONDENCE.

## New York Notes.

New York, December 20.—It developed at Tuesday's meeting of the Rapid Transit Commission that a suit had been begun at the instance of the *Sun* Publishing company, Franklin Bartlett, as trustee of the will of Henry Mason, and Mason Carnes, against the several municipal officers of the city and the Rapid Transit commissioners to restrain the payment of public moneys in the construction of a rapid transit road. Chief Engineer Parsons was mentioned as defendent in the suit against the commissioners, and the Board of Estimate and Apportionment was named in the suit against the city Secretary Delafield presented an estimate of the moneys which would be required to defray the expenses of the board for the period ending April 1, 1896, amounting to $30,118.62.

President Rossiter of the Brooklyn Heights railroad system says that the theater cars promised some months ago will be ready for use on January 1, 1896. There will be three of them. Each will be 25 feet long, running on eight wheels, and each one will be fitted up luxuriously. The interiors will be finished as finely as the interiors of Pullman cars. There will be heavy and expensive curtains and draperies, and the chairs will be richly upholstered with leather. Each car will have a buffet, and there will be other accommodations for the passengers. These cars will be for charter by theater parties, who will pay a certain charge for the trip. The cars will run all over the lines of the system.

A malicious attempt to wreck a trolley car of the Brunswick Traction company is reported from New Brunswick, N. J. A wire of heavy steel had been stretched across the road between that city and Milltown at a height to just miss the motorman's head. A car with eight passengers was going over the road at a rapid rate shortly after 10 o'clock at night, when the car was suddenly stopped, and all the lights immediately went out. The wire had smashed the headlight, torn a portion of the woodwork and disconnected the car from the trolley wire. The steel wire became entangled in the car truck, delaying moving for some time. The car had hardly started when a little farther on a tie was seen stretched across the track. Edward Radel, secretary of the company, believes that the attempt was made by discharged motormen.

Another curious trolley-car accident occurred in Brooklyn recently. A big poplar tree which has stood for many years in front of the house of George A. Powers, at No. 389 Washington avenue, fell to the ground at a few minutes after 1 P. M. It stood within a few feet of Greene avenue and fell directly across the avenue, snapping the trolley wires and brushing with some of its outer branches the top and sides of a Greene and Gates avenue car which was on its downtown trip. Had the car been five feet farther ahead, or had the trunk fallen the same distance farther east, the car would doubtless have been badly crushed, and the lives of its occupants endangered. There were no pedestrians or wagons within range of the trunk or its branches, and no injuries were reported. A strange feature of the incident was the fact that there was no wind swaying the tree at the time. The blocking of the track by the limbs and the breaking of the trolley wires delayed travel on both the uptown and downtown tracks for over an hour. W. F. O.

## In Tennessee.

Memphis, December 21.—The Gamewell fire alarm system is being put in at Jackson, Tenn.

An arc and incandescent lighting plant is being placed in the ferry steamer C. B. Bryan by Lee Whitfield of this city.

All of the electric roads of this city and suburbs have been consolidated under one charter, and the franchise granted to the company by the city council covers a period of 50 years. By this new arrangement transfers are given from 6 A. M. until 7:30 P. M., and several of the lines are to be extended. Frank G. Jones, vice-president and general manager of the company, is busy making preparations for the work.

The firm of Bruce & Boardman has been dissolved by mutual consent. B. M. Bruce takes the business and will continue it at 71 Union street. F. E. Boardman has accepted a position with the Light & Power company of Knoxville, Tenn., and will take charge of that plant as general manager.

The Memphis Light & Power company has fitted up a handsome suite of offices on the ground floor at No. 300 Second street, and has moved its office from the plant on Beal street. J. R.

## Northwestern Notations.

Minneapolis, December 21.—The Board of Public Works in St. Paul is securing information on electric lighting, both municipal and contract. The electric and gas light plants are all under one management in St. Paul, and if bids are asked it is feared that this would be the only concern bidding, which would take away the competitive part. But it is rumored that the Bohn Manufacturing company, which has a private plant for its own works, may put in a bid for a part of the city. Another rumor has it that the street railway company will enter a bid.

The Light & Traction Company of Dubuque, Ia., has been testing an electric heater in one of its street cars. While it does good work, Manager Balch thinks it too costly. It takes about eight horse power.

A committee is making an investigation on an electric light plant for De Witt, Ia.

Langsted & Croswell of Appleton, Wis., have the contract to install a 300 light electric plant for the saw mill of the Ross Lumber Company of Arbor Vitae, about 20 miles north of Rhinelander, Wis.

The city council of Mankato, Minn., voted to take bids for electric lighting and for electric street cars.

The electric light plant for Vinton, Ia., will soon be completed and in operation.

The new electric light plant of Worthington, Minn., is in operation.

The town of St. Ansgar, Ia., has a committee to investigate the matter of electric lights.

The Western Union is rebuilding its line between St. Paul and La Crosse.

W. L. Shanks and John Martin will soon put in an electric light at Big Timber, Minn.

C. E. Laws of Chicago will begin action against the Central Wisconsin Electric company of Oshkosh, Wis., to recover for two miles of track laid. An attempt has been made to continue tracklaying, but it was impossible and the city council threaten to forfeit the franchise if something is not done to show good faith.

The Janesville, Wis., street car system may stop, as it is not paying expenses.

The electric light company of Watertown, S. D., will stop operating unless receipts increase. The plant is not paying expenses at present.

The Cedar Valley Telephone company will soon have connection with Grundy Center, Toledo, and Tama City, Iowa. The company which is putting in a line at Marshalltown will connect with this system in the spring,

as will the company operating at Webster City. Connections are also to be made to connect at Waverly with a system which includes Charles City, Osage, Riceville and other points. The latter will be completed in the early spring.

About 50 new instruments have recently been put in at Fargo, N. D., making a total of 350 telephones in use there.

Delay in the arrival of the switchboard will prevent the opening of the branch telephone exchange in St. Paul until March 1st.

The Western Electric Telephone company of Britt, Iowa, has about 1,000 miles of wire strung and 101 stations, completing about all work projected for this season. In the spring it expects to put on a large force and extend its lines in every direction.

The new telephone exchange of the Iowa Union Telephone company at Decorah, Iowa, will be completed and in operation by January 1st.

Frank McCormick will build a telephone line along the line of the Missabe & Northern Railroad running north from Duluth.

A local telephone company has been formed at Centralia, Wis., and 53 shares were subscribed almost at once. They will not proceed unless they secure four-fifths of the users of the present system to subscribe for stock.

The Clark Automatic Switch company of Sioux City, Iowa, has been granted a franchise for a telephone system at Rock Rapids, Iowa, and has begun work on it.

Construction has begun on a telephone line to run from Sioux City, Iowa, to Yankton, S. D.

Peter Berard of Merrill, Wis., secured the contract to build a toll line between Wausau and Merrill, Wis., at $1,500. It will be the joint property of the Wausau and Merrill Telephone companies and is to be completed in 30 days.

A passenger on an Eighth avenue car in Minneapolis grasped at the wire furnishing current to light the trailer, when the car lurched and broke the wire. It fell and touched the metal on the dashboard of the car and gave out such a flash that the passengers on the platforms of both cars could not see for five minutes.

The Beatrice, Neb., council has under consideration an ordinance requiring all wires removed from the streets to the alleys. The council has also called an election for January 30th to vote on $10,000 bonds for an electric light plant.

The right of way is being secured for the electric line which is proposed to run from La Crosse to Neillsville, Wis., and the directors have decided to build it next summer. Fred H. Pickles of Winona, Minn., is the engineer in charge of the survey.

The Waterloo and Cedar Falls Rapid Transit company has incorporated with $600,000 capital stock, to build an electric car line.

L. E. Hall of Marshalltown, Ia., is an applicant for a franchise for an electric light and steam heating plant at Grinnell, Ia. Such a franchise can be granted only by a vote of the people, and petitions are being circulated to call an election.

The bondholders of the General Electric company of Winona, Minn., have arrived at a settlement and will reorganize. Motions will be made before the United States court in February.

It is understood that the street railway company may bid on the electric street lighting in St. Paul if the specifications call for a five-year contract, but if they call for a single year, the company will probably not enter a bid. It is also rumored that Taylor & Smith, who have a private electric plant, may enter a bid.

The Castner Coal & Coke company, of Belt, Mont., is having plans prepared for an electric light plant to light its mines and buildings and the village, to cost about $22,000.

The city of Brainerd, Minn, has voted to sell its electric light plant to C. N. Parker.

Winston Bros. of Minneapolis are the contractors for an ore railroad to be built between Ishpeming and Marquette, Mich. The force of gravity will carry the loaded cars down there being a fall of 800 feet in the 15 miles between Ishpeming and Marquette. Hiram A. Burt of Marquette, the president of the proposed line, proposes to utilize the power generated running down hill to carry the empty cars back again by having a motor car attached to every 10 or 15 cars, which will contain a dynamo. No brakes will be applied on the down trip, but the motor will be thrown into gear and the force otherwise wasted on brakes will be turned into electrical energy. This will be used to charge accumulators and taken off again by the empty train making the up trip.

Mr. Bartholomew of Grand Forks, N. D., is negotiating for the purchase or the electric light plant at Aberdeen, S. D.

The Seattle Gas & Electric Light Works, of Seattle, Wash., have been bought by a party of Minnesota capitalists, headed by Samuel Hill, president of the Eastern Minnesota railway. The plant will be enlarged and improved.

A franchise has been granted the People's Light, Heat & Power company at Hastings, Neb.

The Rocky Mountain Telegraph company will be succeeded by the Rocky Mountain Postal Telegraph company, which will extend a line from Butte to Denver via Salt Lake and Ogden. Connection with Denver will be made at Pocatello over the Union Pacific, probably via Cheyenne. The proposed line will be 1,500 miles long and the estimated cost is $350,000. Men are now in the East negotiating bonds, and it is expected that they will have matters completed by the middle of January. Work will be pushed rapidly after the bonds are sold.

St. Paul physicians are considering the advisability of organizing a school of medical electricity. M.

## PERSONAL.

A. L. Daniels, representing the H. B. Camp company of Aultman, Ohio, has been in Chicago for a few days.

Julius Auerbach, president of the Auerbach-Woolverton Electric company of Hoboken, N. J., was a visitor to Chicago last week.

C. J. Sturgeon, vice-president and manager of the Keystone Electric company of Erie, Pa., was in Chicago last week on a business trip.

## ELECTRIC LIGHTING.

The proposition to lease the Philadelphia Edison company to the Pennsylvania Heat, Light & Power company will be voted upon by the security holders of the first mentioned company on December 31st.

At a meeting of the aldermen of Waltham, Mass., the special committee on municipal lighting recommended that the city purchase the plant of the Waltham Gas & Electric Light company, and reported that the valuation of the plant was $253,000. The report was accepted.

The Gorham, N. H., Electric Light company has organized under a charter, and will henceforth be known as the Cascade Electric Light & Power company. The new company intends to fully develop its water power, estimated to be 2,000 horse power, and put in large light and power dynamos.

The project of getting power from Ridley creek to run a local electric light plant at the upper end of Chester, Pa., has been given up for the present. An engineer has tested the power of the stream, and finds that it is less than 100 horse power. One hundred and fifty horse power would be required by the plant.

The incoming Common Council of the city of Rochester, N. Y., will have the placing of the contracts for city lighting, which will amount to about $200,000 per year. Heretofore this service has been furnished by the Rochester Gas & Electric company, but it is reported that other companies will compete for part of the prize. The city of Rochester has gained the distinction of being one of the best lighted cities in the country, and the company now furnishing this service naturally bases its claim for preferment upon its former showing.

## ELECTRIC RAILWAYS.

According to Poor's "Directory of Railway Officials" there are 13,176 miles of surface street railways in the United States, of which 10,238 is operated by electricity, 578 miles by cable and 1,950 miles by horse power. The number of horses in use in these railways is now 45,353, which is about 145,000 below the number thus employed only four years ago. Of the 431 miles of street railway in Canada, only 40 miles is operated by horse power, electricity being employed on all the rest.

## TELEPHONE.

The Chicago Telephone company has made arrangements to establish an exchange in Rogers Park. The price of 'phones to patrons will be $42 for the exclusive use of telephones in Rogers Park, but a toll will be charged for the use of the telephones in down-town communications.

The United Telegraph, Telephone & Electric company has been organized to do an exchange business in Hyde Park, Chicago. Yearly contracts will be made at the rate of $36 for residences and $54 for business houses. The company announces that it will open its lines by January 15th with 500 subscribers. Twenty-five miles of poles and wires and 60,000 feet of underground wire are said to be in position now. The Stromburg-Carlson patents, known as the Stromburg telephone system, will be used. District messenger and telegraph service are also features of the new concern. The company bought from the County Court the franchise of the Hyde Park District Telegraph & Electric company, which was chartered by the old town of Hyde Park in January, 1889. The legal details were arranged so that the United company was empowered to proceed under the old charter. The officers are: President, John G. Earle; vice-president, James S. McConnell; secretary, E. P. McConnell; general manager, Thomas W. Sennott.

## TELEGRAPH.

The telegraph companies are prepared to handle the Republican national convention at St. Louis. Night Manager J. C. Barclay of the Western Union company at Chicago said: "There are hundreds of wires that can be used for the convention alone. We can easily send 65,000 words an hour from St. Louis to Chicago. We have wires from that point to New York direct, and by way of Chicago, Pittsburg, Indianapolis, or any of the cities that intervene. We can keep 50 men sending to Chicago direct, 20 men sending to New York direct, and have any number of side wires by way of other cities. We can as easily furnish New York 65,000 words an hour as we can Chicago. No; we are satisfied. Chicago is our best distributing point, but St. Louis is all right." Mr. Gregory of the Postal Telegraph company said that his company was in a position to handle everything that the newspapers or the public might want. He added: "We are well equipped in St. Louis, almost as well as in Chicago, and for business reasons we are glad the convention will be held there. We will have a longer haul to the east and will get some of the Chicago business. Of course we would have liked it here, but we will be able to take care of it all right in St. Louis."

## MISCELLANEOUS.

The report comes from Great Barrington, Mass., that William Stanley of Pittsfield is to establish a factory for the manufacture of electrical supplies in that town.

Ex-Congressman Jerry Simpson, replying to a letter of inquiry from a Greenfield, Ind., capitalist as to a proposed electric light plant at Medicine Lodge, Kas., wrote this characteristic letter: "Will say that Medicine Lodge is not the place you are looking for, for several reasons. First, not sufficient population and all too poor; can hardly afford to buy oil; too much protection and gold standard has done us up; corn 15 cents and everything else in proportion. Give us free silver and free trade and then you can come out west with your electric light plant. We need it, but at present we can stand it to read our mortgages by the lights of the 15-cent corn fire."

## TRADE NEWS.

The Sessions Foundry company has issued tasteful invitations requesting the recipents to attend the opening of the new works at Bristol, Conn., on December 27th, between 9 A. M. and 5 P. M.

Accurate measurement of time is a necessity. This gives us what we term "accurate time." The electric system furnished by the Standard Electric Time company of Waterbury, Conn., indicates this accurate time uniformly on many dials, making an equipment for schools, public buildings, factories, etc., that is valuable and that is coming into very general use. A time plant in a building is being considered as important as a lighting or heating plant. The company's automatic programme bell ringing attachment is connected with and run on the same accurate time as the self-winding regulator, which is used for the master clock. This may also be said of the electric tower clock, watchman's clock and electric time register the company installs. Its battery gauge is the only one of its kind.

In the Suffolk County Court yesterday, says the *Boston Transcript* of December 18th, the schedule of liabilities and assets of George D. Burton, the inventor and electrician, who is a petitioner in insolvency, were filed. Mr. Burton, who invented the stock car that bears his name, was the organizer and for a time the manager of the Burton Stock Car company, with plant in Kansas. Dr. J. C. Moore of Manchester, N. H., is largely interested in it. Others of Mr. Burton's companies were formed on patents taken out by him for electric forging, welding and heating. The Burton Electric Forging & Heating company, of which the debtor was president, operated in New England, and has its headquarters in this city. Mr. Burton has taken out a large number of patents, about 100, it is said. He was born and bred in New Hampshire, and came to Boston to find a field for his enterprise. He is about 40 years old. He owes $117,700, and has as assets stored machinery, stock in various companies, notes, etc., of what market value has not yet been determined.

## BUSINESS.

"Chain Blocks" are exhaustively treated in a pamphlet just issued by the Yale & Towne Manufacturing company. The report of official tests and a graphical comparison are given to show the great efficiency of the Yale & Towne blocks.

J. F. Shawhan, lately with the Shawhan-Thresher Electric company, Dayton, O., has disposed of his interest in this company and is now located at 30 South St. Clair street, Dayton, where he will be engaged in business for himself.

Continued satisfactory sales of the Garlock high pressure packing for steam plants are reported. This material is made of selected fiber and metal in combination with the Garlock packing compound, and is furnished in sizes ranging from one-fourth inch to two inches square.

The Electric Appliance company is rapidly securing its share of the interior conduit business. With a large stock and a high grade article at a low price, the company is making itself felt in the conduit field, which is becoming such an essential tributary to the electrical supply business.

F. M. Bernardin of Kansas City reports that he has recently placed large orders for electric light and railway poles in Missouri and Kansas, including 500 for the Metropolitan Street Railway company of Kansas City. Mr. Bernardin is also pushing the sale of the Warner electric car heater, which has met with considerable success, owing to its simplicity of construction and economy of current.

E. F. Peck, vice-president of the National Electric Light association, who for the last 10 years has been the general superintendent of the Citizens' Electric Illuminating company of Brooklyn, N. Y., has formed a company, to be known as the Peck Electrical company, with

an office at 15 Cortlandt street, New York. The company proposes to manufacture and deal in electrical specialties and supplies and also to engage in electrical engineering in all its branches. Mr. Peck's long and practical experience as superintendent of one of the largest and most successful electric lighting plants in the country, together with his recognized capacity as an electrical engineer, will undoubtedly command for the company a large share of public and private patronage.

The Michigan Electric company of Detroit, Mich., reports a most satisfactory growth of its business during the year. Since August, when the company was appointed Michigan agent for the General Electric company, it has been most successful in securing orders for machinery, etc., of the General company's manufacture, some notable contracts being: Newcomb, Endicott & Co., Detroit, one 35 kilowatt moderate speed multipolar generator; Hunter, Glenn & Hunter, Detroit, one 40 kilowatt multipolar directly driven, and one 17½ kilowatt multipolar moderate speed generator; Baldwin, McGraw & Co., Detroit, one 17.5 multipolar moderate speed generator; Mabley & Co. building, Detroit, four 130 and one 40 kilowatt, all multipolar directly driven lighting generators; Ann Arbor Thomson-Houston Electric company, Ann Arbor, Mich., one 120 kilowatt 1,040 volt alternating current generator, one 125 light 2,000 candle power Brush arc generator, one marble switchboard for alternating current and arc circuits. In sales of Edison incandescent lamps and General Electric company's lighting supplies it has secured a very large amount of business, the new type Edison lamp having proven a particular favorite with the trade. In the railway line the company has secured an order for four double General Electric 1,200 motor equipments for the equipment of the Oakland County railroad, to run from Detroit to Pontiac, and has the promise of a number of other orders for similar equipments. The General Incandescent Arc Light company's constant potential arc lamps have been pushed with such success that they are now used almost exclusively in Detroit and vicinity. The company has also had great success with the Simplex wire, having secured its exclusive adoption in the Chamber of Commerce, Home Savings Bank, Elliott, Valpey, and many other of the most prominent buildings in that section, including the new Mabley building (14 stories), which will be the largest building in Michigan. Other specialties for which the company is agent, such as Cutter flush switches, Automatic Switch company's motor starters, etc., have been pushed to such good effect that they are now universally used in all first-class installations. The Michigan overhead material, which this company manufactures, has had a very satisfactory sale.

# ILLUSTRATED ELECTRICAL PATENT RECORD.

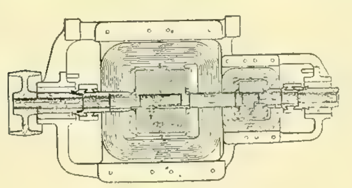
*Issued December 17, 1895.*

551,357. Incandescent Electric Lamp. Charles A. Beal, Abington, Mass. Application filed February 28, 1895.

One claim is for a double filament lamp, having a central contact piece, to which one of the limbs of each filament is connected, and two side contact pieces insulated from each other, to which the other limbs of the filaments are connected, the contact pieces lying in the same concentric circle around the central contact piece.

551,364. Magnetic Electric Lamp Holder. Martin H. Collom, Denver, Colo. Application filed June 12, 1895.

The combination is claimed of the lamp, the socket and an electro-magnet in circuit, having its pole or poles exposed and adapted to make contact with magnetic surfaces, whereby the lamp and socket may be placed in contact with, and by means of magnetic attraction may be adjustably and removably suspended from, magnetic surfaces.



NO. 551,371.

551,371. Means for Operating and Regulating Speed of Electric Motors. Rudolf Eickemeyer, Yonkers, N. Y. Application filed December 31, 1892.

The motor is provided with a governing field coil; a governing dynamo is driven by the motor, and a switch for controlling the line current connections with the motor and with the dynamo, and also controlling the delivery of current generated by the dynamo to the governing field coil of the motor.

551,372. Electric Programme Clock. Frederick Frick, Waynesborough, Pa. Application filed April 29, 1895.

A contact spring is provided with a projection, and the stationary contact piece projecting from the base of the machine and arranged under the free end of the spring, a circuit breaker consisting of a disk provided with radial holes and removable pins for depressing the contact spring, and driving mechanism operating to revolve the circuit breaker step by step.

551,391. Automatic Telephone Exchange System. William F. Lounsbury, Owego, N. Y. Application filed April 23, 1895.

An arrangement is described consisting of the combination of a given number of telephones located at respective sub-stations, independent electric conductors connecting each telephone with all the other telephones respectively, a circuit closer in circuit with each of the conductors, and means located at the central station governed by devices located at the sub-stations for controlling the circuit closers in a predetermined manner.

551,427. Heat Regulator. William W. Wilcox, Westerly, R. I. Application filed April 6, 1895.

A movable receptacle for liquid is operatively connected to a heat controlling valve or damper, and there are provided a liquid supply for the receptacle, thermostatic means for controlling the flow of liquid into the receptacle, and distinct thermostatic means for controlling the escape of liquid from the vessel.

551,436. Electric Meter. Thomas Duncan, Fort Wayne, Ind. Application filed July 11, 1895.

Features of the invention are: A vertical spindle carrying an armature and retarding fans, a vertical post adjustable in its bearing and having a jewel setting in a removable or separable part at its upper end, upon which the spindle rotates, and a cup-shaped nut surmounting or covering the jewel and adjustable upon the vertical post.

551,451. Electric Lighter. Herbert E. Rider and John H. Decker, New York, N. Y. Application filed November 10, 1894.

The principal parts in this device are a torch, a receptacle for the same, and an electric spark-forming device, the device being actuated by the withdrawal of the torch to form a spark, but being unaffected by restoring the torch.

551,461. Art of Producing Carbide of Calcium. William C. Clarke, New York, N. Y. Application filed April 29, 1895.

The process consists in causing current to pass between horizontally disposed electrodes embedded in a mass of pulverized and intimately commingled lime and carbon of such extent that a material proportion thereof will remain undecomposed by the passage of the current and gradually separating the electrodes as the material between them is reduced, so as to produce between the electrodes a body of the carbide surrounded by an undecomposed mass of the pulverulent mixture.

551,470. Controlling Electric Motors. David Mason, Schenectady, N. Y. Application filed April 22, 1892.

The combination is claimed of two or more electric motors, a series multiple switching device for controlling the motors, and means for opening the circuit of the armature of one motor while the connections are changing from series to multiple arc.

551,534. Closed Conduit Electric Railway System. Frederick C. Esmond, Brooklyn, N. Y. Application filed April 12, 1895.

The combination includes an insulated supply conductor, working conductor sections, switches and magnets for operating the switches, with a double set of overlapping collectors leading to the motor, and a switch for including a resistance in the circuit between the motor and the rear set of collectors in either direction of motion of the car.

551,536. Closed Conduit Electric Railway System. Frederick C. Esmond, Brooklyn, N. Y. Application filed April 26, 1895.

The combination is claimed of a supply conductor, working conductor sections or points arranged in sets of three, double collectors and a battery or other source of current adapted to be connected to the different collectors.

551,537. Closed Conduit System for Electric Railways. Frederick C. Esmond, Brooklyn, N. Y. Application filed September 11, 1895.

Features of the invention are: An insulated supply conductor, a series of working contact sections normally disconnected from the supply conductor, a series of switches for connecting the contact sections with the supply conductor, and a series of electro-magnets for operating the switches whose coils are connected at an intermediate point in such manner as to form a path for current through only a portion of the magnet coils.

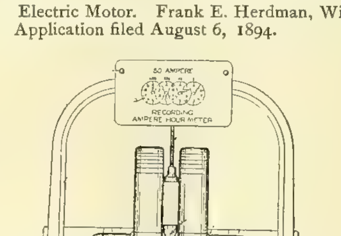
551,567. Electric Motor. Merle J. Wightman and Oscar C. G. Urban, Cleveland, O. Application filed May 16, 1893.

An electric motor is described, having a pole-piece constructed in two sections, the rearward or outer section whereof is removable, whereby the inner section is capable of being moved outwardly or backwardly from the armature.

551,587. Electric Railway. Rudolph M. Hunter, Philadelphia, Pa. Application filed February 23, 1887.

An electrically propelled vehicle is combined with an electric motor, made substantially cylindrical and supported directly by the axle independent of and between the wheels, and a commutator and brushes for the field magnets and armature.

551,633. Electric Motor. Frank E. Herdman, Winnetka, Ill. Application filed August 6, 1894.



NO. 551,436.

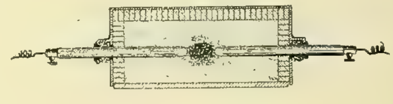
An electric motor, a source of current supply, electrical connection between the fields and current source, a weighted arm adapted in its movement in one direction to decrease the amount of current in the field, and in the other direction to increase the current in the field, a bar connected to the weighted arm provided with flanged ends, an operating bar and a bell-crank, one end connected to the operating bar, the other end being provided with a roller adapted to rest adjacent to the flange of the bar.

551,634. Mechanism for Admission and Regulation of Currents to Motors. Frank E. Herdman, Winnetka, Ill. Application filed March 29, 1895.

In combination with a source of current supply a translating device is employed, together with circuit connections to the translating device, a switch for controlling the admission of current to the translating device, and operating mechanism for controlling the switch, a device adapted in its movement to vary the current strength in the circuit to the translating device, actuating mechanism adapted to move the device in one direction, and mechanism connected with the operating mechanism, adapted by the movement of the operating mechanism to move the actuating mechanism and the current varying device in the other direction.

551,635. Mechanism for Admission of Currents to Motors and Regulation of Currents in Same. Frank E. Herdman, Winnetka, Ill. Application filed June 28, 1895.

One claim is given: In combination with a source of current supply, a translating device and circuit connections to said translating device, of a device adapted in its movement to vary the current strength in the circuit to the translating device, a solenoid, connection between the current regulating device and core of the solenoid, an operating bar, a crank upon said bar, an arm, a slot and pin or equivalent connection between said arm and crank, and connection between said arm and the solenoid core, spring contacts connected with said current varying device in the circuit to the solenoid, said contacts being normally closed and controlled by the action of the pin and walls of the slot, and wire connection between said contacts, including resistances.



NO. 551,461.

551,664. Electric Railway Motor Shield. Isaac F. Baker and William R. McLain, Lynn, Mass. Application filed November 25, 1889.

A propelling electric motor is sustained or supported beneath the body of the car, and a protective pan or shield is formed in jointed sections and sustained between the motor and the ground, and suitable fastening devices for detachably securing the free end of the pan in elevated position are provided.

551,674. Telephone Transmitter. Theodore Grissinger, Mechanicsburg, Pa. Application filed October 18, 1894.

There are a granulated conducting medium, a vibrator adapted to agitate the conducting medium in accordance with sound vibrations, a casing for the conducting medium and vibrator, and means for conducting an electric current laterally through the granulated conducting medium, and at a right angle to the movements of the vibrator.

551,682. Electric Lock. Philip Meyer and Julius A. Meyer, Newark, N. J. Application filed February 23, 1895.

This lock combines with the case a bolt head pivoted inside the case and projecting outward therefrom, an armature lever linked to the pivoted bolt head to turn the same inward when the magnet is energized, and an electro-magnet arranged within the case, all the parts being arranged and operating.

551,712. Dynamo-electric Machine. Alexander B. Blackburn and William Buchanan, Wolverhampton, Eng. Application filed October 1, 1895.

An exciting coil is combined with two or more armature coils, and sets of laminated magnetic material, some embracing one armature coil and some another, and an inductor having projections to close the magnetic circuits successively, whereby there is little or no fluctuation in the number of lines through the exciting coil.

551,734. Transmission of Electricity to Moving Cars. Thomas Nesom, Indianapolis, Ind. Application filed September 21, 1894.

In a system for transmitting electricity to a moving car there are employed a box containing feed wires, a conduit holder placed above such box in sections, an insulating block between such sections, a conduit in such conduit holder, a line conductor within such conduit, and connecting wires from the feed wires extending through such insulating blocks to the line conductor.

551,743. System for Regulating Effective Tension of Electrical Circuits. Hermann O. W. J. Breul, Berlin, Germany. Application filed November 17, 1893.

There is claimed the combination with a consumption circuit of a number of feeding conductors connected therewith, means for increasing or decreasing the electromotive force impressed upon the several feeding conductors, and a device responsive to the reversal of current in a feeding conductor.

# ROYAL ELECTRIC CO., PEORIA, ILL.,

MANUFACTURERS OF THE

# "ROYAL ALTERNATOR."

No Commutator! No Moving Wire! Efficiency High! Regulation Close! Fully Guaranteed!

TRANSFORMERS OF ANY DESCRIPTION. DIRECT CURRENT GENERATORS AND MOTORS.

AGENCIES { EASTERN:—H. B. COHO & CO., 203 Broadway, New York.
CENTRAL WESTERN:—E. B. HILLMAN & CO., Peoria, Ill.
SOUTHWESTERN:—CINOCCHIO ELECTRIC CO., Dallas, Texas.

WE are selling the highest grades of **Electric Street Railway** specialties. We have recently added to our already large line, the General Western Agency for the Billings & Spencer **Drop-forged** Trolley Equipment and Commutator Segments. These several devices represent the best work that has been accomplished in overhead construction appliances.

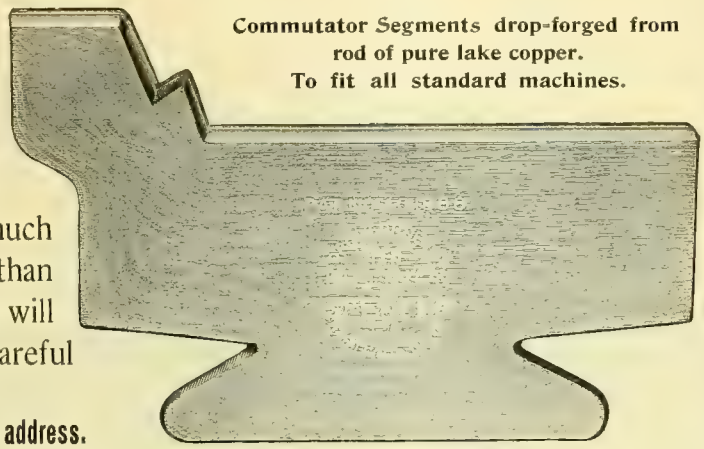
The insulation (colophite) used with these devices is an entirely new element in the field of dielectrics. It will stand a much higher mechanical strain than other compounds, and as a positive insulation it is superior to hard rubber.

## Western Buyers

Will be able to supply themselves from our Chicago Stock with much less expense and time than formerly. All orders will be given prompt and careful attention.

**Railway Catalogue to any address.**

**Commutator Segments drop-forged from rod of pure lake copper. To fit all standard machines.**



**The eleventh hour** is a good time to order the **twelfth Motor,** and there's no better time than **July** to sell it. Are you going to complete the dozen and reap the benefit? Remember we can ship the same day you order.

### Heaven is Reached by Stages.

**Burcham Harding Tells the Theosophical Society What Happens After Death**

The other evening Burcham Harding addressed a meeting at the rooms of the Loyalty branch of the Theosophical Society, No. 15 Washington Street. His subject was, "What Happens After Death?" He said in part:

"When we get rid of the physical body we pass into Kama-loca, where is the second death, the death of the lower nature. It is the selfish and the animal that we must drop into Kama-loca, while the unselfish passes into a higher state. The stay in Kama-loca is necessary to get rid of our lower nature, which may be described as the intellectual animal. Passions, hatreds, selfishness of all kinds are lived over in Kama-loca, but with this difference, they have nobody by which to express them and they gradually die out. When the second death has taken taken place the now freed soul passes up to Devachan, or heaven. There it is the higher mind is conscious. We are told that the period between two incarnations varies greatly from a few months to 1,000 or 1,500 years."

---

CHICAGO continues to amaze us with her ingenious census figures. Gradually she is swelling herself towards the 2,000,000 mark. But, O Chicago! it is time wasted. Even should you leave this city's population far behind in numbers—which you probably will never do—you would not be New York. Figures are unimportant in some things, O Chicago! The centipede is not as great as the race horse, although he has twenty-five times as many legs. When you have done your counting ask yourself how many Chicago men it takes to make a New York man and you will realize how vain your arithmetic is.—New York World.

The reader is requested to notice the unmistakable undertone of sadness that pervades the foregoing in spite of its assumption of hilarity.

---

### Didn't Like It.

*Tankley*: Goggins sent me a bottle yesterday, containing a snake preserved in alcohol.

*Grimes*: Think he ment to insult you?

*Tankley*: I don't know, but I certainly do not appreciate the gift nor the spirit in which it was tendered.

---

### Renewal of Sectional Bitterness.

Texan (at the grocery store)—"What do you call them things?"

Grocer—"Those are olives."

"Are they good to eat?"

"Certainly. Try one of them."

(Bites into one) "Jest as I expected. Got a wooden core. Come from Connecticut, don't they?"—Tribune.

---

### Same Old, Old Story.

"I proposed to Miss Gladys Beautigirl last night."

"Ah! and she accepted you?"

"Well no—o—o, not exactly, but she came so near doing so that a great deal of the sting was taken out of her refusal. She said she would have accepted me if I had had plenty of money and a perfect disposition, and my eyes were brown instead of blue, and my hair curly, and I was two inches taller, and was winning fame in my profession, and possessed personal magnetism, and came from an old and blue-blooded family, and would always let her have her own way, and never smoked nor wanted to stay out late at night, and did not belong to any lodge, and would keep a stylish turnout and plenty of servants, and really wanted her mamma to live with us, and a few other things which I have forgotten. But if a fellow must fail in an undertaking, it is encouraging to him to think that he came very near winning."—Harper's Bazar.

---

### I Ought To and I Will.

Strange lack of connection generally between these two points! The electric button of commerce is touched, and in an instant New York responds to San Francisco. We have cultivated our machinery, but the prompt action of our wills we have not improved. To the well trained man the thought "I ought to" should instantly arouse the determination "I will."

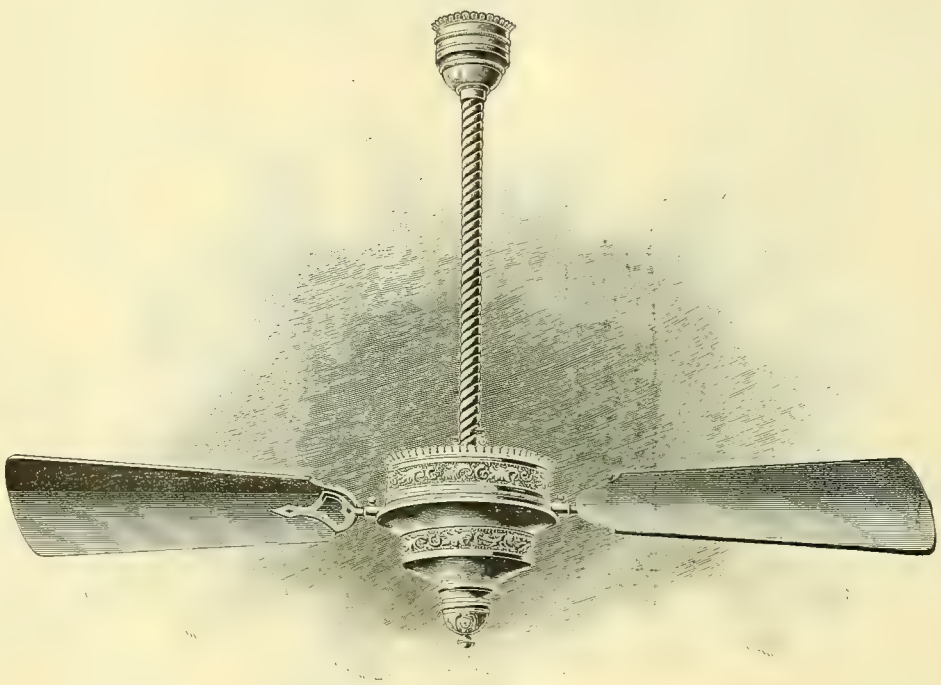
A resolution grows rusty when it is not used Every time that hesitation arises between these two points the machinery of the will suffers; the delays lengthen with each neglect, and the whole character is weakened.

# THE NEW DIEHL ELECTRIC CEILING FAN,

## JUST PERFECTED.

Increased Efficiency, with a saving of 25 per cent in use of current required.

New and attractive designs.



Improved Mechanical Construction, including a New and Thoroughly Effective oiling device.

Wound for 110, 125, 170, 220, 250, 500 Volts,

## DIRECT INCANDESCENT

OR

## ANY DIRECT ARC CURRENT.

## DIRECT CURRENT SLOW SPEED

# Multipolar Generators and Motors.

These machines are constructed with ***external armatures.*** They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow speed machines, made for direct-connection in sizes from 20 H. P. to 2,000 H. P.

### ADVANTAGES OF OUR EXTERNAL ARMATURE TYPE.

Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding on armature. Lowest internal resistance of Armature. Only three to four volts difference of potential between commutator bars. Greatest weight of copper per ampere of current. Greatest radiating surface possible. Maximum magnetic effect. Armatures cannot burn out. Great compactness. Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.) Finest quality of iron, excellent finish, absence of binding wire. ***In 8 years' continuous service not one armature has been replaced or repaired.***

### OVER 200,000 H. P. IN USE

***For Railway, Lighting and Motor Service.*** World's Fair Diploma and Medal for ***best*** direct-connected Generator.

# MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

With Siemens Drum Armatures, which are copied extensively in this country. We are building these machines in sizes from 1 H. P. to 150 H. P.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.
Colored Glass Insulators to designate different currents.

**WORK ON SPECIAL DESIGNS A FEATURE.**

Address **THE STIRLING COMPANY,**
Pullman Bldg, CHICAGO, ILL.

## WANTED.

Situation as Superintendent, Electrician or Steam Engineer of an electric light or street railway. Seven years practical experience operating and constructing light and power systems. One year as superintendent of a large light and power plant. Fifteen years constructing and operating steam apparatus. Machinist by trade; experience with water power.
"C. H." care WESTERN ELECTRICIAN.

## PROPOSALS.

Department of the Interior, Washington, D. C., June 27, 1895. Sealed proposals, in duplicate, will be received at the Department of the Interior until 2 o'clock p. m. Monday, July 22, 1895, for the furnishing and installation of an Electric Light Plant at the Government Hospital for the insane near Washington, D. C., in accordance with specifications to be had on application to the Department. A certified check for five per cent. of the amount of the bid must accompany each proposal Bond with approved sureties for the faithful performance of the contract will be required of the successful bidders. The right is reserved to reject any and all bids, to waive technical defects and to accept any part of any bid, or reject the other part if the interests of the Government require it. Proposals must be submitted in duplicate, addressed to the Secretary of the Interior, Washington, D. C., sealed and endorsed on the envelope: "Proposals for Electric Light Plant for the Government Hospital for the Insane." The proposals received will be opened at the time and place above stated and bidders are invited to be present at such opening. WM. H. SIMS, Acting Secretary.

# The Electric Motor and its Applications.

By T. C. MARTIN AND JOSEPH WETZLER.

With an Appendix by Dr. Louis Bell, bringing the book down to date.

***Cloth. 315 Large Quarto Pages, 353 Illustrations. Price, $3.00.***

The wealth of information contained in the three hundred and odd large double-column pages of this important work is equalled in few special technical treatises, even those of a professedly exhaustive character. More than one hundred different motors are described and illustrated—many in great detail—and the different applications are similarly fully treated. Many of the illustrations are full page, and the details of construction, particularly of armatures, are fully illustrated. The treatment is simple, clear, and concise, and little mathematics is employed, the work being essentially of a practical and largely of a descriptive character. The section on alternating motors resumes in a simple manner without mathematical formulæ, the principles upon which they are based, and that on thermo-magnetic motors treats this interesting class in greater detail than can be found in any other publication. An interesting feature is the historical method of treatment, by means of which the different steps in the advance of theories and design can be clearly traced, and the varying results of explorations in many directions instructively followed.

CONTENTS.

Chapter I. Elementary Considerations.—Chapter II. Early Motors and Experiments in Europe.—Chapter III. Early Motors and Experiments in America.—Chapter IV. The Electrical Transmission of Power.—Chapter V. The Modern Electric Railway and Tramway in Europe.—Chapter VI. The Modern Electric Railway and Street-car Line in America.—Chapter VII. The use of Storage Batteries with Electric Motors for Street Railways.—Chapter VIII. The Industrial Application of Electric Motors in Europe.—Chapter IX. The Industrial Application of Electric Motors in America.—Chapter X. Electric Motors in Marine and Aerial Navigation.—Chapter XI. Telpherage.—Chapters XII, XIII. Latest American Motors and Motor Systems.—Chapter XIV. Latest European Motors and motor Systems.—Chapter XV. Alternating Current Motors.—Chapter XVI. Thermo-magnetic Motors.—Appendix. The development of the Electric Motors since 1888.

## CHICAGO SHORTHAND INSTITUTE, 35th St. and Wabash Ave.

**A Central School of Shorthand and Typewriting of the most Modern and Complete Type.**

**A COMPLETE COURSE OF SHORTHAND.** We offer you shorthand instructions in abundance, and most excellent in quality. Our course is graded and arranged in logical order. We claim not a new system, but a new method of imparting the art of shorthand by which we can equip any ordinary intelligent person for the execution of any stenographic work devolving upon the expert stenographer or court reporter.

The method of instruction employed is practical and progressive. The principles are taken up and explained in an orderly manner, and the student directed how to apply them correctly in the work of forming the characters rapidly and artistically. You may have access to the quintessence of the standard systems—Pitman, Munson, Graham. We guarantee to turn you out a full-fledged stenographer capable of any kind of stenographic work. The art is made a specialty.

Tuition, $10.00 per month. Secure class seats immediately.

Evening classes, $5.00 per month. 98 per cent. of our students hold positions.

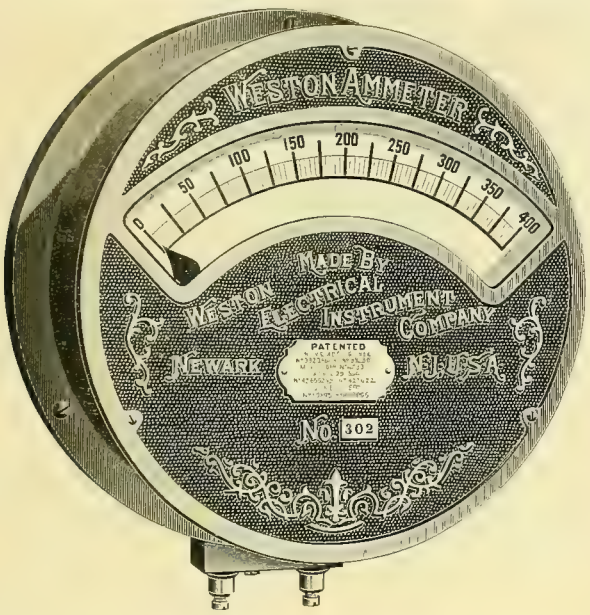
**For the Stevens Flush Switch,** fire and damp proof. Mechanism is simplicity itself. Nothing to get out of order. Make and break so wide that no arc can form. Wired without removing casing. Buttons made of mother of pearl. Base made of vulcabeston with porcelain cases.

**Impossible for them to get out of order.**

# CHEAP, BUT GOOD

# SWITCHBOARD INSTRUMENTS.

The Weston Electrical Instrument Company desires to particularly call the attention of Electric Railway Companies, Electrical Engineers, Contractors and other users of electrical apparatus, to a new line of **very cheap** but **excellent** Ammeters, designed expressly for Railway Feeder and other power circuits, and designated as the



## WESTON ROUND PATTERN

## RAILWAY FEEDER AMMETERS.

These instruments have proportional scales, and are sufficiently sensitive to respond to and indicate in any part of the scale a change of one-tenth of one per cent. of the full load.

They are perfectly dead-beat, and will correctly indicate the strength of the current on circuits in which the most violent fluctuations in load occur.

They are very economical of power, in fact, so much so that you cannot afford to use any other type of instrument, even if they are presented to you.

Notwithstanding the very low cost of these instruments they are most carefully designed, and every detail has been most carefully studied, and each working part so proportioned and constructed as to give perfect service under the most trying conditions of practical use. Each part is made to gauge by special tools, all parts are absolutely interchangeable, thus making the cost for repairs, in case of accidental injury, very low.

The bearings are highly polished sapphire jewels, and the pivots are hardened steel, accurately ground and polished, thus insuring a minimum of friction and maximum durability.

The working parts are enclosed in neatly designed and nicely finished dust-proof iron cases, which very effectually shield the instruments from disturbances by external fields.

The instruments are carefully standardized and guaranteed.

We make a corresponding line of Voltmeters, equally good and very low in price, and specially adapted for small plants.

## CAUTION.

Beware of specifications which are so drawn as to compel the use of the many wretched soft iron gravity instruments on the market, and which are invariably drawn by the makers of such instruments, or by persons under their influence, so as to preclude your securing the best apparatus. Whenever you find specifications so drawn you may rest assured that some one is more interested in forcing upon you inferior apparatus, than in protecting you from continuous heavy loss resulting from the great waste of power in such instruments, and continuous annoyance arising from the impossibility of forming a correct idea of the actual load upon your plants, owing to the excessive oscillation of the moving parts of such instruments, under rapidly varying loads.

Bear in mind that we make a specialty of manufacturing electrical instruments, and that our apparatus is designed with greater care and made by methods wholly different from and infinitely better than those employed by any other firm in the world.

As a consequence of these facts, our instruments are used in, and shipped to, all parts of the civilized world.

We have conscientiously labored to serve station managers by placing at their disposal instruments and appliances better adapted than any previously known to secure economical and good service. We solicit your support, and we hold ourselves in readiness to at all times serve you to the best of our ability in securing economy and satisfactory service from central stations of all kinds.

We make a larger variety of station and portable instruments than any other concern in the world, and we are prepared to make Ammeters of any capacity up to 100,000 amperes.

Remember that poor instruments, even if furnished to you free of cost, cause you loss and frequently great annoyance.

We solicit your trade.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.06 | 119.17 | 141.58 | 205.27 | 79 76 |
| ⅞ " | 16.42 | 122.00 | 127.18 | 195.19 | 83.58 |

## SHORT JOURNEYS ON A LONG ROAD

Is the characteristic title of a profusely illustrated book containing over one hundred pages of charmingly written descriptions of summer resorts in the country north and west of Chicago. The reading matter is new, the illustrations are new, and the information therein will be new to almost everyone.

A copy of "Short Journeys on a Long Road" will be sent free to anyone who will enclose ten cents (to pay postage) to GEO. H. HEAFFORD, General Passenger Agent Chicago, Milwaukee & St. Paul Railway, Chicago, Ill.

## Going to California.

The Burlington Route is the only railway running "Personally Conducted" Excursions via Denver to Colorado Springs, Salt Lake, Ogden, Sacramento, San Francisco, Stockton, Merced, Fresno, Bakersfield, and Los Angeles at the lowest rates and without change of cars.

Leave Chicago every Wednesday. Write or call on T. A. Grady, Excursion Manager, 211 Clark Street, Chicago.

## A Testimonial from the Laboratory of Thos. A. Edison.

ORANGE, N. J., February 6, 1894.

*CLONBROCK STEAM BOILER WORKS, Brooklyn, N. Y.*

DEAR SIRS:—Your letter of the 30th ultimo is received. I have a Climax boiler, and it is giving great satisfaction. Taking everything in consideration, it is, in my opinion, practically and theoretically, the best boiler so far invented.

THOS. A. EDISON.

Every Light and Power reader of the Western Electrician would do well to commit to memory the above testimonial.

## THE "MORRIN"

**CLIMAX STEAM GENERATOR**

Has been acknowledged by all practical minds the best boiler invented.

MANUFACTURED BY

# Westinghouse Electric and Manufacturing Company,

## Sole Owners of the

# TESLA POLYPHASE SYSTEM.

The ideal system for the distribution of power and light in factories and mills.

Motors, Arc Lights and Incandescent Lights supplied from the same circuits.

The system adopted by the Cataract Construction Company for their great plant at Niagara.

Adapted for transmission of power over long distances, also for local distribution of power.

Brushes and moving contacts may be dispensed with, rendering the system peculiary useful in mining operations.

All machinery in our new works at East Pittsburg driven by Tesla Polyphase Motors, supplied from a Central Power Plant.

RESULTS: High Efficiency, Convenience, Economy of Installation and Operation, and Flexibility.

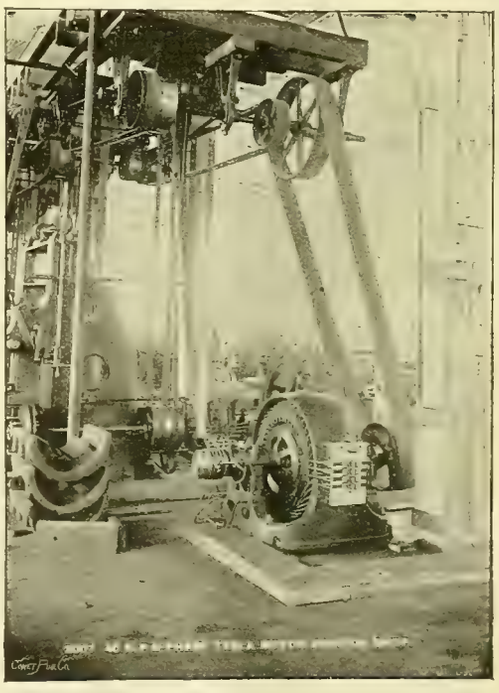
Inspection invited.

---

Two suits are now pending against the Thomson-Houston Company under the Tesla Patents. Upon motion of the Westinghouse Company in the Circuit Court at New Haven recently, the Thomson-Houston Co. were limited to October 7th to take their testimony in defense. The suits will therefore be ready for argument in the near future.

The novelty of Mr. Tesla's invention was recognized by ***PROF. ELIHU THOMSON,*** who said in discussing the Tesla inventions before the American Institute of Electrical Engineers in 1888:

"I have certainly been very much interested in the description given by Mr. Tesla of his ***new and admirable*** little motor. I have, as probably you may be aware, worked in somewhat similar directions and towards the attainment of similar ends. The trials which I have made have been by the use of a ***single*** alternating current circuit, not a ***double*** alternating circuit."



Forty Horse Power Tesla Polyphase Motor operating machinery in shops at East Pittsburg.

# Westinghouse Electric & Manufacturing Company,

Branch offices in all the leading cities.

"SHIP" CORED

(Trade Mark.)

# CARBONS FOR ARC LAMPS,

MANUFACTURED BY

**SCHIFF, JORDAN & CO., VIENNA, AUSTRIA.**

SEND FOR SAMPLES AND PRICE LIST TO

**A. DERONDE & CO.,** Sole Agents. **254 Front St., NEW YORK.**

**Alternating Current**

**ARC LAMPS.**

## The Kester '95

**IS THE LAMP YOU HAVE HOPED FOR.**

It is the only perfected Arc Lamp for the alternator, either high or low frequency.

It comprises all that is desired in an Arc Lamp.

Write for pamphlet and prices to

**THE F. P. LITTLE**

**Electrical Construction & Supply Company,**

**135 SENECA STREET,**

**BUFFALO, N. Y.**

## Be Patient and Don't Worry

**TIMES ARE FAST IMPROVING.**

The fall will soon be here, when your output of current will be largely increased.

**WRITE TO ME FOR CATALOGUE**

—ON—

**ARC LAMPS AND IMPORTED CARBONS.**

General Incandescent Arc Light Co.'s

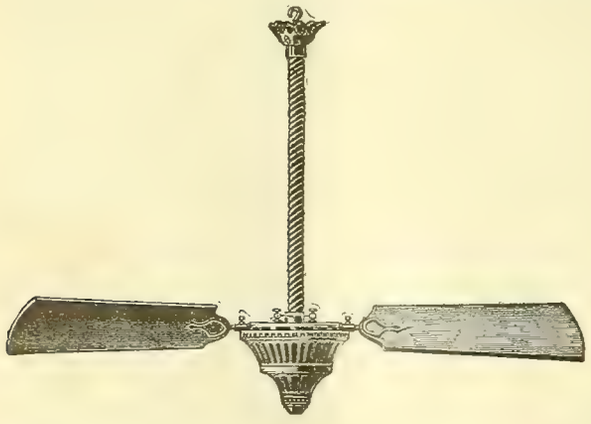
"BERGMANN" LAMPS.

"KNIGHT" LAMPS. Imported "Nurnberg" Carbons.

## R. B. COREY,

General Sales Agent,

Havemeyer Building, - - NEW YORK.



**AN EMPHATIC SUCCESS!**
**THE DIEHL ELECTRIC FANS WIRED IN A SERIES OF TWO OR MORE ON A STREET RAILWAY CURRENT.**

**DIEHL & COMPANY, 385 BROADWAY, NEW YORK.**

## Interior Conduit

Has never been equaled in Quality or Popularity.

## Lundell Fan Motors

The most successful and perfect fan made.

## Pharos Lamps

Carefully constructed to the smallest detail. Life and efficiency answers the most critical demands.

## Okonite Wire

The premier of insulated wires. For use anywhere for any purpose. It never disappoints.

OKONITE IT NEVER DISAPPOINTS

## Central Electric Company,

173-175 Adams St.,

CHICAGO.

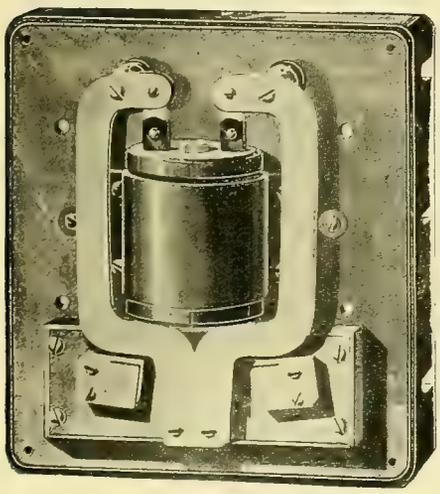
BRANCH:
Southern Electrical Supply Co.,
St. Louis, Mo.

New Orleans Office:
W. M. Brooke, 1010 Canal St.

BRANCH;
Gate City Electric Company,
Kansas City, Mo.

# SINCE MARCH 1st

# Our New (Model 1895) Electric Light and Power Controllers



HAVE BEEN ADOPTED BY CENTRAL STATIONS OPERATING

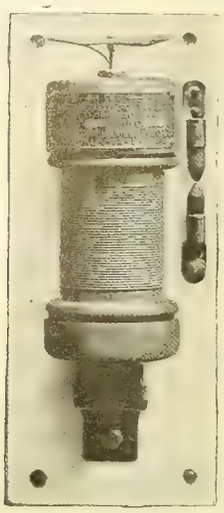
**5,000** ARC LAMPS AND **60,000** INCANDESCENTS.

They are the Only System which will Cut $\frac{On}{Out}$ your Motors, Arc Lights, Converters, Transformers, from your Central Station.

OUR GENERAL WESTERN AGENTS ARE

# WALLACE ELECTRIC CO., 305 DEARBORN ST., CHICAGO.

# ELECTRIC SELECTOR & SIGNAL CO., 45 Broadway, New York.



"CHIMMIE FADDEN" HAD A HARD TIME MAKING HIS ENGLISH UNDERSTOOD.

# IS THIS PLAIN ENOUGH?

**The Garton Arresters have given better satisfaction than any other on the market.**

**REASON WHY?**

Our old customers have been the largest purchasers this year!
Sales so far this season, three times the number sold last year!
For use on any voltage, either direct or alternating!
Our Railway Arresters cannot be beaten!

**PRICES ARE RIGHT.**

NO INDUCTIVE RESISTANCE.
NO PIVOTS OR HINGES.
NO FUSES TO BLOW.
REQUIRE NO ATTENTION.
ARE ALWAYS READY.

In the United States, and in Central America and other foreign countries, where the most severe electrical storms occur, the Garton Arresters have been adopted by the leading companies, thus proving that they give the highest efficiency and best of satisfaction.

Write for information and prices to our agents or to the

## GARTON-DANIELS ELECTRIC CO.,

KEOKUK, IOWA, U. S. A.

# The S. K. C. Two Phase Alternating Current System.

THE FIRST AND ONLY COMPLETE AND PERFECTED SYSTEM BY WHICH LIGHT AND POWER CAN BE SUPPLIED FROM THE SAME GENERATOR AND CIRCUITS. POWER TRANSMISSION AND DISTRIBUTION MADE PRACTICAL AND COMMERCIALLY SUCCESSFUL.

## POINTS OF SUPERIORITY:

Our system is much more simple and consequently more durable than any other, either direct or alternating.

Our generator is much more efficient than any other alternator, requires less attention and absolutely no supplies except lubricant for bearings.

It is practically self-regulating without the loss of energy involved by compounding or compensating. Other multiphase machines require a balance of load.

We have entirely eliminated from our generators the usual sources of trouble, expense and interruption of service: i. e., the revolving armature, commutator, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to the high voltages required for power transmission work; in latter case doing away with the expense and loss of step-up transformers; the usual central station machine can be connected at will for either 1,000 or 2,000 volts.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in uniformity of speed under different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

**Patents**—Our apparatus is novel, different from anything heretofore made, and covered by patents that fully protect us and our customers. We are not infringing patents belonging to others, and shall avail ourselves of the patents under which we operate to protect ourselves from piracy by other manufacturers.

## STANLEY ELECTRIC MANUFACTURING CO., PITTSFIELD, .... MASS.

Western Office, 305 Dearborn Street, Chicago, Ill.

# Will You Be In It? Yes!

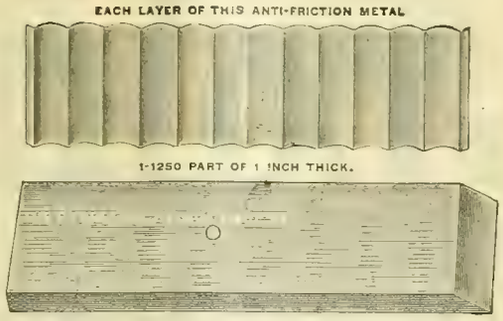
## USE THE BOUDREAUX DYNAMO BRUSH.

The Boudreaux Dynamo Brush Co. NO GAUZE.

The Boudreaux Dynamo Brush Co. NO CARBON.

NO SPARKING. NO CUTTING.

NO TRIMMING. NO GREASING.



The Boudreaux Dynamo Brush Co. NO WOVEN WIRE.

The Boudreaux Dynamo Brush Co. NO COPPER.

**THE BOUDREAUX DYNAMO BRUSH CO.,**

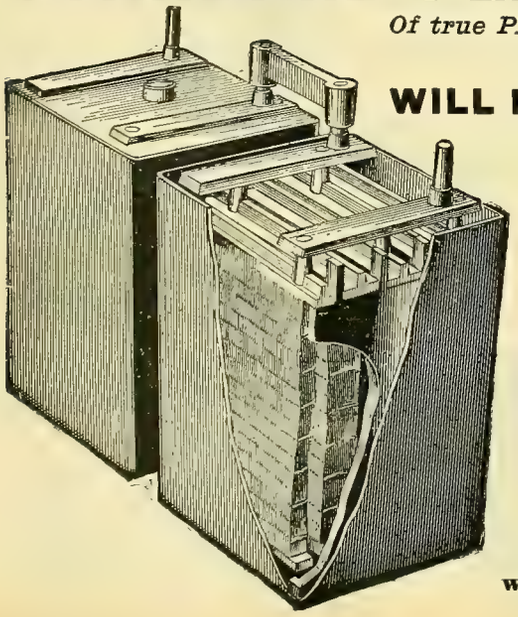
# STANDARD PLANTE STORAGE BATTERIES

*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.



**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ **CHALLENGE:** We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.
Colored Glass Insulators to designate different currents.

**WORK ON SPECIAL DESIGNS A FEATURE.**

Send Model or Drawing and we will furnish estimates.

**HEMINGRAY GLASS CO.,**

Office, Covington, Ky. —ESTABLISHED 1848.— Factories, Muncie, Ind.

THE

# "CLARK" WIRE.

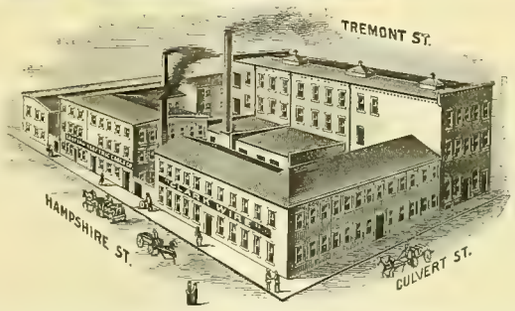
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**BRANCH OFFICE:**

1649, 1650, 1651 MONADNOCK BLDG.,
CHICAGO, ILLINOIS.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

# The Electric Railway of To-Day.

By H. B. PRINDLE.

60 PAGES, PROFUSELY ILLUSTRATED.

## PRICE 50 CENTS.

The author describes the **ELECTRIC RAILWAY SYSTEM** in a popular manner, using such language that the reader who is unfamiliar with technical terms can readily understand the construction of the apparatus and the functions of various appliances used in the electrical propulsion of street cars.

It contains a vast amount of useful and valuable information for every motorman and those interested generally in Electric Railway work and improvement.

**CHICAGO SHORTHAND INSTITUTE, 35th St. and Wabash Ave.**

**A Central School of Shorthand and Typewriting of the most Modern and Complete Type.**

**A COMPLETE COURSE OF SHORTHAND.** We offer you shorthand instructions in abundance, and most excellent in quality. Our course is graded and arranged in logical order. We claim not a new system, but a new method of imparting the art of shorthand by which we can equip any ordinary intelligent person for the execution of any stenographic work devolving upon the expert stenographer or court reporter.

The method of instruction employed is practical and progressive. The principles are taken up and explained in an orderly manner, and the student directed how to apply them correctly in the work of forming the characters rapidly and artistically. You may have access to the quintessence of the standard systems—Pitman, Munson, Graham. We guarantee to turn you out a full-fledged stenographer capable of any kind of stenographic work. The art is made a specialty.

Tuition, $10.00 per month. Secure class seats immediately.

Evening classes, $5.00 per month. 98 per cent. of our students hold positions.

# ELECTRICITY FOR ENGINEERS.

New Edition, Just Out! Now Published in One Complete Volume, 424 Pages, Profusely Illustrated.
Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

**PART I. CONTENTS.**—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force; Volts; Resistance; Ohms; Current: Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures, Construction of, Different Kinds of; Commutators, How Made and Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction; Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields; Constant Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; Operated in Series; Automatic Cut-Out; In Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-Out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Unsteadiness; Remedy; Effect of Shades or Globes; Shape of Carbons under Different Conditions of Burning; Arc Lamps; Regulating and Cut-Out Mechanism; Action of Current; Clutch Lamps; Clockwork Lamps; Double Lamps; Troubles in Lamps.—CHAPTER VII: Commutators and Brushes; The Brush Commutators; Brushes; Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box; Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation; The Dynamo; Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation; Brush Armature; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial; Dial Controller; Circuits and Connections of No. 8 Brush Dynamo; Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTER XI: The Edison System; Automatic Regulator; Circuits of Regulator; Circuits of Dynamo; Action of Regulator; Howell Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits; The Regulator and Motor; Action of Regulator.—CHAPTER XIII; Schuyler System of Automatic Current Regulation; Dynamo; Armature, Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator.—CHAPTER XIV: Thomson-Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wall Controller; Diagram of Circuits; Air Blast.—CHAPTER XV: Waterhouse System of Three-Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere Meters; Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters; Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Astatic Needle; Differential Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of Use; Bridge and Rheostat; Round Form; Square Form.—CHAPTER XX: The Magneto as a Testing Instrument; Armature; Field; Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket; Change Over Plug and Socket; Conclusion. CHAPTER XXIII: Electric Motors, General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motors; Of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

**PART II. CONTENTS.**—CHAPTER I: Alternate Current Dynamos; Principles of the Field. Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamos, Continued; The Mordey Alternator; Stationary Armatures; Field Magnets; Ferranti Armature, Field Magnets; Winding; Collectors.—CHAPTER III: Dynamos, Concluded; Siemens Dynamo; Best Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation.—CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution; An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction; Transformers.—CHAPTER V; Transformers, Continued; Induction Coils; Converters; Transforming Up and Down; Design of Transformers; The Static Charge; Protection Against; Grounding the Secondary; Other Devices; The Foil Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses; Regulation; Winding of Transformers; Connecting to Circuit; Regulation; Safety Fuses.—CHAPTER VII; Parallel System; Series Arc Light System; Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Placing of Transformers; Fuses; Diagram of Series Arc Light Circuit.—CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Penetration; The Circuit of Lines of Force; Experiments with Magnet; Rapidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp; Action of the Mechanism; Flat Carbons.—CHAPTER X: Arc Lamps, in Multiple; Slattery Differential Lamp; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from those used with Continuous Currents; Ammeters; Voltmeters; Description of Several Forms of Instruments.—CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter; Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters; Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters; Curled Spring Meter.—CHAPTER XV: Twisted Strip Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operation; Diagrams of Parts; Slattery Induction Meter; Description of Parts and Principles of Operation; Watt Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Machines for Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

PRICE, $2.50.

## INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

**Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.**

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

**CONTENTS.**

**PART I.—Polyphase Currents.**

CHAPTER 1. ..Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3....The Tesla Rotating Magnetic Field.—Motors with Closed Conductors. —Synchronizing Motors —Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

**PART II.—The Tesla Effects with High Frequency and High Potential Currents.**

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St Louis Lectures On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31...."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

**PART III.—Miscellaneous Inventions and Writings.**

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

**PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.**

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

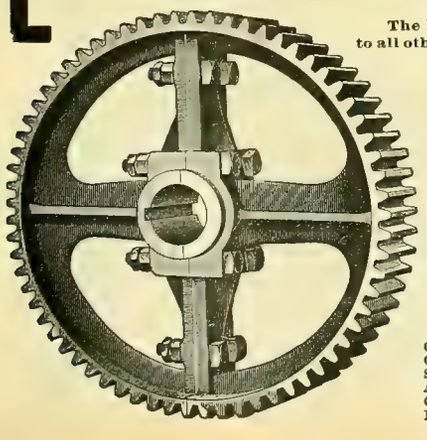
**This volume is of the utmost interest and value to all in any wise concerned in the study, production or utilization of electric currents. Sent postage free, to any address, on receipt of price, by**

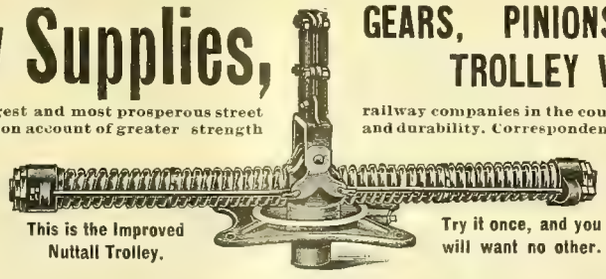
**ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago.**

# Electric Railway Supplies,

The largest and most prosperous street railway companies in the country are using our supplies, and they prefer them to all others on account of greater strength and durability. Correspondence Solicited.

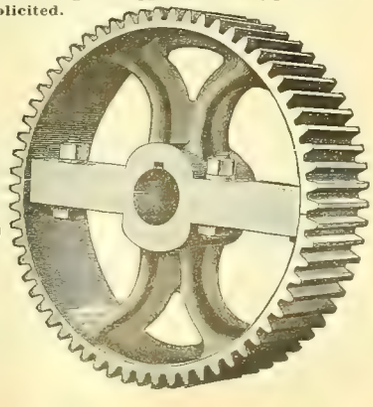
GEARS, PINIONS, BEARINGS, TROLLEYS, TROLLEY WHEELS AND HARPS.





This is the Improved Nuttall Trolley.

Try it once, and you will want no other.



# R. D. NUTTALL COMPANY,

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

# Westinghouse Electric and Manufacturing Company,

## Sole Owners of the

# TESLA POLYPHASE SYSTEM.

The ideal system for the distribution of power and light in factories and mills.

Motors, Arc Lights and Incandescent Lights supplied from the same circuits.

The system adopted by the Cataract Construction Company for their great plant at Niagara.

Adapted for transmission of power over long distances, also for local distribution of power.

Brushes and moving contacts may be dispensed with, rendering the system peculiary useful in mining operations.

All machinery in our new works at East Pittsburg driven by Tesla Polyphase Motors, supplied from a Central Power Plant.

RESULTS: High Efficiency, Convenience, Economy of Installation and Operation, and Flexibility.

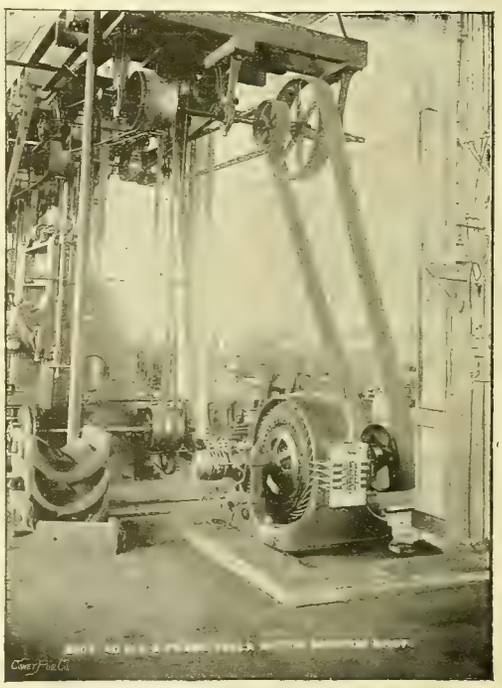
Inspection invited.

---

Two suits are now pending against the Thomson-Houston Company under the Tesla Patents. Upon motion of the Westinghouse Company in the Circuit Court at New Haven recently, the Thomson-Houston Co. were limited to October 7th to take their testimony in defense. The suits will therefore be ready for argument in the near future.

The novelty of Mr. Tesla's invention was recognized by ***PROF. ELIHU THOMSON,*** who said in discussing the Tesla inventions before the American Institute of Electrical Engineers in 1888:

"I have certainly been very much interested in the description given by Mr. Tesla of his ***new and admirable*** little motor. I have, as probably you may be aware, worked in somewhat similar directions and towards the attainment of similar ends. The trials which I have made have been by the use of a ***single*** alternating current circuit, not a ***double*** alternating circuit."



Forty Horse Power Tesla Polyphase Motor operating machinery in shops at East Pittsburg.

ELECTRICAL STORAGE CELLS OF ANY DESIRED CAPACITY

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

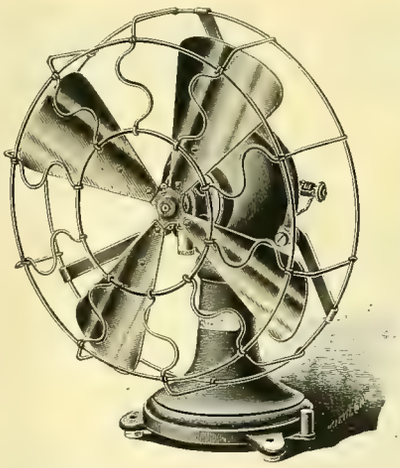
# The Main Exhibit.

We **don't want a single man** who visits the convention this week to miss a trip to our store.

Whatever we may have at the hotel parlors will be but a mere hint to the **main exhibit** at **173=175 Adams St.**

It is a short walk from the Leland caravansary, or if you prefer a ride, take cars at corner of Michigan Avenue and Adams Street going West. Get off at La Salle and look for the OKONITE sign.

If the weather takes a calorific turn, and it's likely to do that very thing; or the "proceedings" wax a trifle tiresome, just run over long enough to regain your equilibrium in the reposeful coolness of a **Lundell Breeze.** Competent critics have declared our salesrooms the coolest in Chicago, it's all mechanical however and not due to a lack of warm hospitality—you will find plenty of that in various ways. You will also find a complete installation of Interior Conduit, showing its flexibility and adaptation to every form of work and proving its claim to superiority over every other method of interior distribution.



Electric House Goods, Central Station Supplies and Electric Railway Materials are displayed in prodigal profusion. Cases of Testing Sets and Meters, gems of the instrument maker's art, are shown. And other goods that come in cases that really must be seen to be appreciated. We are "at home" all day—suit your own convenience.

## Central Electric Company,

## After Dinner Yarns.

### Obeying Orders.

The story is told that when, after the second battle of Bull Run, Gen. Sickles assumed command of a division of the army of the Potomac, he gave an elaborate farewell dinner to the officers of his old Excelsior Brigade.

"Now, boys, we will have a family gathering," he said to them, as they assembled in his quarters. Pointing to the table, he continued, "Treat it as you would the enemy."

As the feast ended, an Irish officer, Capt. Byrnes, was discovered by Sickles in the act of stowing away three bottles of champagne in his saddle-bags.

"What are you doing, sir?" gasped the astonished General.

"Obeying orders, sir," replied the Captain in a firm voice. "You told us to treat that dinner as we would the enemy, and you know, General, what we can't kill we capture."

### Chauncey's New Story.

Chauncey M. Depew has a new story—one which he won't tell the next time he goes to Chicago. Here it is:

"There was once a prominent man in Chicago who, like all others out there, had a very exalted opinion of his own city. He died, and when he reached his eternal home he looked about him with much surprise and said to the attendant who had opened the gate for him, 'Really, this does great credit to Chicago. I expected some change in heaven.'

"The attendant eyed the Chicagoan a second and then observed, 'This isn't heaven.'"

### There Was.

He (resuming his seat after a brief visit outside)—"What an atmosphere of realism there is about this play!"

She—"Yes. Smells like cloves."

### Reed and His Gloves.

Tom Reed never wears a silk hat. He bought one six years ago and braved public sentiment beneath it for nearly a fortnight, but he couldn't bear the pressure any longer than that. It made him uncomfortable. It didn't fit the bumps on his head, and altogether he didn't think it harmonized with the contour of his face or of his body. Hats have always been a source of trouble and annoyance to him. When he first came to Congress he wore a little saucer-like arrangement, with a narrow brim, that made his face look twice its natural size, and gave him generally a schoolboy air. His friends weaned him of that, but they have never been able to induce him to give any particular attention to dress.

It is only lately that Mr. Reed has taken to wearing gloves, except in the coldest weather. The day the print of the tariff bill, with its innumerable committee amendments appeared. Reed walked into the House, hung up his hat in the cloak-room, and began to wander about the floor, conspicuously holding the bill before him in his gloved hands.

Baker of New Hampshire caught on to the queer combination and whispered hurriedly to Boutelle, "For heaven's sake speak to Reed! He'll be wandering around here absent-mindedly all day with his gloves on if you don't."

Boutelle sidled up to his big colleague and began to pull his coat sleeve. "Get back into the cloak room, Tom," he whispered, "and pull off your gloves. You'll have the whole house laughing at you."

Reed turned solemnly upon the Bangor man and held up the bill he was carrying. "Charles," he said, "why do you speak with so little consideration? Can't you see that I can't trust myself yet to handle this thing without gloves?"

### A Field of Relics.

"Yes, sir," said the Georgia land agent to the northern prospector, "you kin plow up a peck of bullets here every week."

"But are they genuine?"

"You bet they air! Don't I buy 'em an' plant 'em myself? An right where you're a-standin' is a bombshell that I traded a cow for an' it's gittin' jest as rusty as if it wuz throwed thar by the war!"—Atlanta Constitution.

### A New Beer.

There is an intelligent actor here, who is improving his idle time before next season in selling or trying to sell, a fine Shakespeare. The other day he called on a good natured but rather dense German who keeps a beer hall on Dearborn street.

"Good day," he said to the ruddy proprietor. "I am selling Shakespeare."

"Nein," said the German. "I vant to make no change. I haf already Pabst peer und Schlitz peer, and I don't dink I vant Chake's peer."

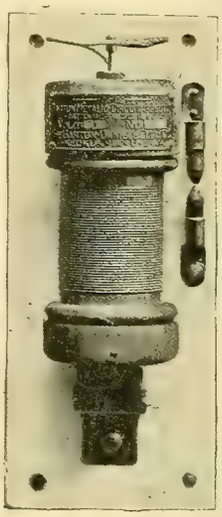
"No, no, my friend," protested the actor-book agent, "you misunderstand me. This is a book."

"O, doss all right," said the German. "I haf bock, too."

SAY,

# DO YOU USE THE GARTON ARRESTERS?

IF NOT,



You don't know that feeling of security that comes to all that have a full equipment.

"Safe in the storm that may gather,
Tho' the blue juice may come thick and fast;
Wild and infernal the weather,
The Garton's protect till the last."

**NO INDUCTIVE RESISTANCE. NO PIVOTS OR HINGES.**
**NO FUSES TO BLOW. REQUIRE NO ATTENTION. ARE ALWAYS READY.**

Don't try to get through the balance of the season without them. They don't cost as much as armatures, and will last you an indefinite time. Write to-day.

## GARTON-DANIELS ELECTRIC CO.,

## ELECTRIC APPLIANCE COMPANY

## 242 MADISON ST. - CHICAGO.

# Do You Recall

. . . . The well-known fact that a combination once existed that proposed to dictate its own terms to every central station, to every owner of an electric lighting system, and where an inclination was shown not to accede to the cut-throat demands to enter the local field and destroy the business years and capital had built up? Well, we had the pleasure of setting the pace for that combination to execute its retrograde movement by, and we have enjoyed the fun of seeing it swallow its own threats and go down into history as a picturesque failure in the bluffing line. And now we are securing orders from its own licensees for the Standard system of electric lighting. Why? Because no other system is so simple, so efficient electrically, so perfect mechanically, so moderate in first cost, with maintenance charges so small. As there can only be one "best," so there is only one *Standard* to judge the imitators by. We build that Standard.

Study our book: 'twill put money in thy purse. Mailed free.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.
Colored Glass Insulators to designate different currents.

**WORK ON SPECIAL DESIGNS A FEATURE.**

THE

# "CLARK" WIRE.

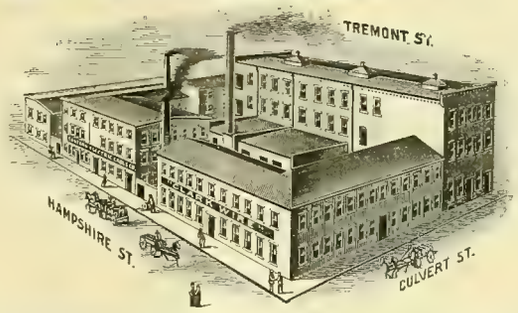
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**BRANCH OFFICE:**

1649, 1650, 1651 MONADNOCK BLDG.,
CHICAGO, ILLINOIS.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

## NOTICE.

Notice is hereby given that the Council of the City of Springfield, Mo., will receive sealed proposals up to eight o'clock P. M. of Friday, the twenty-sixth day of July, 1895, for furnishing said city with one hundred and fifty Arc Electric Lights, of 2,000 candle power, to burn on moonlight schedule, except that lights must burn on all dark and cloudy nights.

Proposals must state prices at which the above lights will be furnished on a one, three or five year contract, and give the maximum prices to be charged consumers for Arc and Incandescent Lights for commercial and domestic use.

Each proposal must be accompanied by a detailed description of the plant proposed to be used for furnishing said lights, and no proposal will be considered that is not accompanied by such description.

Each proposal must be accompanied by a certified check for the sum of One Thousand Dollars, ($1,000.00), conditioned that the bidder will enter into contract in compliance with such proposal if accepted.

The City Council reserves the right to reject any and all proposals.

J. FENTON, Mayor.

ATTEST:
G. W. HACKNEY, City Clerk.

CHICAGO SHORTHAND INSTITUTE, 35th St. and Wabash Ave.

A Central School of Shorthand and Typewriting of the most Modern and Complete Type.

A COMPLETE COURSE OF SHORTHAND. We offer you shorthand instructions in abundance, and most excellent in quality Our course is graded and arranged in logical order. We claim not a new system but a new method of imparting the art of shorthand by which we can equip any ordinary intelligent person for the execution of any stenographic work devolving upon the expert stenographer or court reporter.

The method of instruction employed is practical and progressive. The principles are taken up and explained in an orderly manner, and the student directed how to apply them correctly in the work of forming the characters rapidly and artistically. You may have access to the quintessence of the standard systems—Pitman, Munson, Graham. We guarantee to turn you out a full-fledged stenographer capable of any kind of stenographic work The art is made a specialty.

Tuition, $10.00 per month Secure class seats immediately.
Evening classes, $5.00 per month. 98 per cent. of our students hold positions.

## Continuous Current Dynamos and Motors:

THEIR THEORY, DESIGN, AND TESTING.

With Sections on Indicator Diagrams, Properties of Saturated Steam, Belting Calculations, Etc.

AN ELEMENTARY TREATISE FOR STUDENTS.

By FRANK P. COX, B.S.

**Cloth. 271 Pages, 83 Illustrations. Price $2.00.**

Intended for students, this work gives the theory and design of continuous current dynamos and motors as understood and practiced in the designing-room, and the methods of testing described are those of the factory testing-shop. The practical side of the various questions treated is always kept in view, discussions having little bearing in this direction being excluded, and the higher branches of mathematics avoided. The application to the design of armatures, field-magnets and motors of the principles developed is explained by reference to numerical problems, thus thoroughly impressing them on the student's mind. Methods of testing a complete machine and of investigating its characteristics are given, with discussions on the effect of various changes in design and operation. The steam-engine being so closely allied to the testing and operation of dynamos and motors, sections on indicator diagrams, steampower calculations, and belting are included. Almost all of the numerous curves in the book are derived from actual commercial tests.

CONTENTS.

Chapter I. The Absolute System of Measurement.—Chapter II. Electro-Magnetic Induction.—Chapter III. Classification of Machines and General Principles of the Magnetic Circuit.—Chapter IV. The Dynamo as a Motor.—Chapter V. Calculations Pertaining to the Magnetic Circuit.—Chapter VI. Theory of Windings, Losses, etc —Chapter VII. The Dynamo Considered as a Motor.—Chapter VIII. Design of Armatures.—Chapter IX. Design of field-magnets.—Chapter X. Design of Motors.—Chapter XI. Dynamo and Motor Testing.—Chapter XII. Efficiency Tests.—Chapter XIII.—Indicator Diagrams.—Chapter XIV. Steam-Engine Calculations.—Appendix I. Tests of Iron.—Appendix II. Ampere Turntables.—Appendix III. Determination of Sizes of Wire for Armatures and Field Coils.—Appendix IV. Belting.

# Just What You Are Looking For!

A NEW AND VALUABLE BOOK.

# ELECTRIC LIGHTING PLANTS,

## THEIR COST AND OPERATION.

By W. J. BUCKLEY.

Data compiled from station reports of electric lighting plants employing overhead circuits, with suggestions pertaining to the information usually desired by the non-technical purchaser.

*With Numerous Illustrations, Diagrams, Plans, Tables, Etc. 275 Pages. Cloth. Price $2.00, Postage Free.*

This work gives all necessary data for the erection of an electric light plant of any size.

**THE COST OF ARC LIGHTING.** **THE COST OF INCANDESCENT LIGHTING.**

**READ THE TABLE OF CONTENTS:**

Alternating Arc Lamps, Arc Plants, Belting, Boilers, Boiler Settings, Boiler Efficiencies, Books, Building, Cost of Arc Dynamos and Lamps, Cost of Arc Plants Erected, Cost of Alternating Dynamos, Cost of Alternating Plants Erected, Cost of Belts, Cost of Boilers, Cost of Brick Chimneys, Cost of Copper for Alternating Circuit, Cost of Corliss Engines, Cost of Compound Corliss Engines, Cost of Compound High Speed Engines, Cost of Condensers, Cost of Friction Clutch Pulleys, Cost of Heaters, Cost of High Speed Engines, Cost of Incandescent Dynamos, Cost of Idlers, Cost of Injectors, Cost of Meters, Cost of Motors, Cost of Operating Lamps per hour, Cost of Power Generators, Cost of Poles, Cost of Plain Pulleys, Cost of Pillow Blocks, Cost of Pumps, Cost of Shafting, Cost of Shaft Couplings, Cost of Stacks—iron, Cost of Stacks—brick, Cost of Steam, Cost of Transformers, Cost of Wire, Chimneys, Circuit Loss, Contract Blanks, Current Distribution, Circuits—overhead, Circular Mile of Wire, Depreciation, Direct Connected Apparatus; Dynamos, Dynamo Data, Economy of Condensing, Economy of Covering Steam Pipes, Economy of Heater, Efficiency of Engines, Engines, Equivalent of Current in Horse Power, Equivalent Rates of Lighting, Fuel, Horse Power of Belting, Horse Power of Motors, Horse Power of Shafting, Incandescent Arc Lamps, Instruments, Instructions for Employes, Insulation, Labor, Load Chart, Meter Connections, Municipal Ownership, Natural Gas, N. E. L. A. Standard Rules, Oil, Outcome of Practical Management, Pole Line, Pulleys, Rope Transmission, Resistance of Wire, Rules—Fire Underwriters, Report Com. on Data N. E. L. A., Reports of Cities Owning Plant, Reports of Cities Contracting, Stock Room, Shafting, Transformers, Transformer Curves, Wiring Tables—Primary Wiring, Wiring Tables—Secondary Wiring, Wiring Tables, Motor Wiring, Wire, Wire Formula, Water Power, Wood as Fuel.

University Bldg., **Milwaukee, Wis.**

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases**. Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

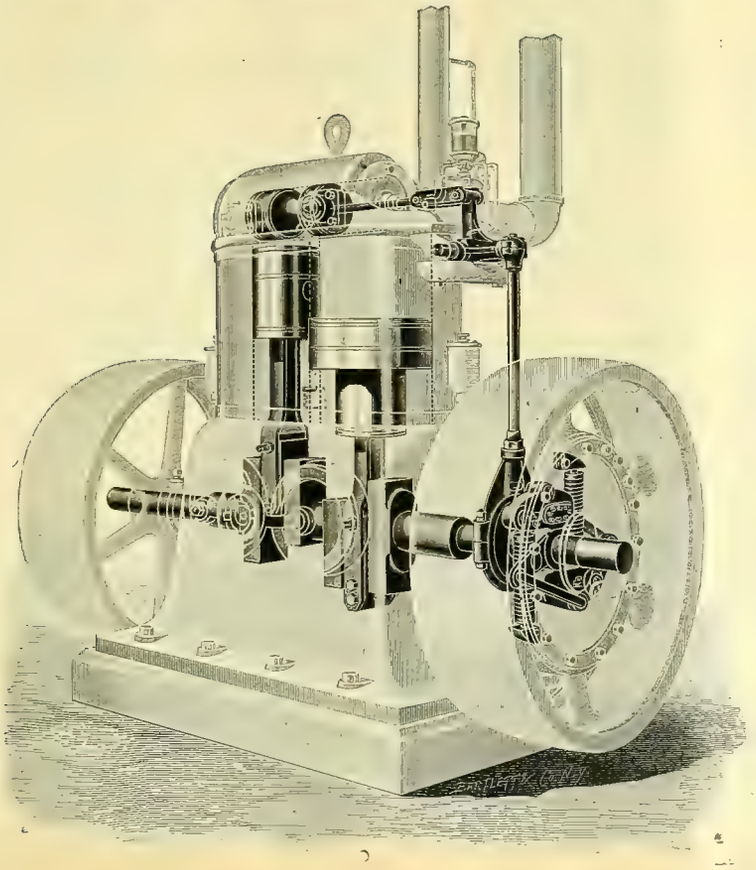
4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

SEND IN YOUR ORDER NOW.

**ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago, Illinois.**

# A Business Proposition:



***Any purchaser, so desiring, is welcome to have his engine tested by his own expert at our shops before shipment, and may accept or reject the engine on that test before incurring the expense of installation.***

## THE WESTINGHOUSE ENGINE.

**THREE TYPES.**

**Compound, 5 to 1,000 H. P.,** Unequaled simplicity, high efficiency and moderate cost.
**Standard, 5 to 250 H. P.,** A high-class automatic, endorsed by thousands of users.
**Junior, 5 to 75 H. P.,** A durable and efficient automatic engine at a low price.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

# Westinghouse Electric and Manufacturing Company,

## Sole Owners of the

# TESLA POLYPHASE SYSTEM.

The ideal system for the distribution of power and light in factories and mills.

Motors, Arc Lights and Incandescent Lights supplied from the same circuits.

The system adopted by the Cataract Construction Company for their great plant at Niagara.

Adapted for transmission of power over long distances, also for local distribution of power.

Brushes and moving contacts may be dispensed with, rendering the system peculiary useful in mining operations.

All machinery in our new works at East Pittsburg driven by Tesla Polyphase Motors, supplied from a Central Power Plant.

RESULTS: High Efficiency, Convenience, Economy of Installation and Operation, and Flexibility.

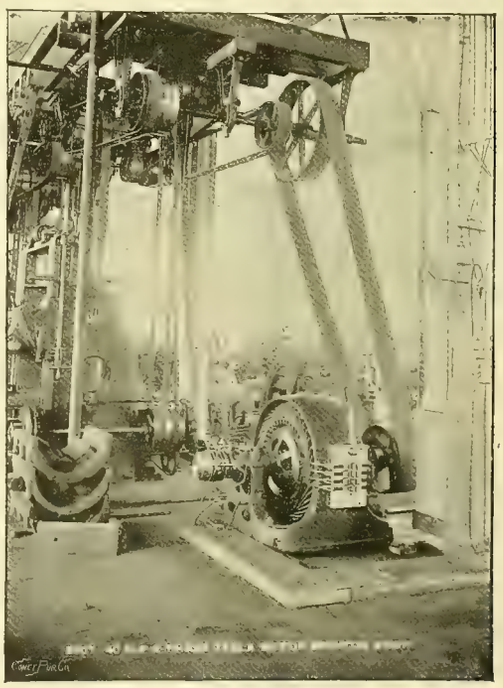
Inspection invited.

---

Two suits are now pending against the Thomson-Houston Company under the Tesla Patents. Upon motion of the Westinghouse Company in the Circuit Court at New Haven recently, the Thomson-Houston Co. were limited to October 7th to take their testimony in defense. The suits will therefore be ready for argument in the near future.

The novelty of Mr. Tesla's invention was recognized by ***PROF. ELIHU THOMSON,*** who said in discussing the Tesla inventions before the American Institute of Electrical Engineers in 1888:

"I have certainly been very much interested in the description given by Mr. Tesla of his ***new and admirable*** little motor. I have, as probably you may be aware, worked in somewhat similar directions and towards the attainment of similar ends. The trials which I have made have been by the use of a ***single*** alternating current circuit, not a ***double*** alternating circuit."



Forty Horse Power Tesla Polyphase Motor operating machinery in shops at East Pittsburg.

**STEAM ENGINEERING**

TAUGHT BY MAIL THOROUGH PRACTICAL

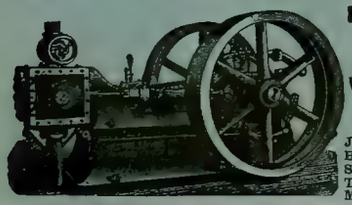
*(Stationary, Locomotive or Marine); Mechanics; Mechanical Drawing; Electricity; Architecture; Architectural Drawing and Designing; Masonry; Carpentry and Joinery; Ornamental and Structural Iron Work; Railroad Engineering; Bridge Engineering; Municipal Engineering; Plumbing and Heating; Coal and Metal Mining; Prospecting, and the English Branches.* Students make rapid progress in learning to Draw and Letter. The Steam Engineering course is intended to qualify engineers to secure Licenses. Send for free Circular, stating the subject you wish to study, to

The International Correspondence Schools, Scranton, Pa.

**TO MANUFACTURERS.**

Space, light, heat and power **FREE** at *Matthews, Grant County, Ind.*, to concerns that employ a limited number of men. Ample railroad facilities, healthy location, good schools, improved streets, electric lights, etc. Address GEO. N. CATTERSON, Treas., 24 Kentucky Ave., Indianapolis, Ind.

**WESTON ENGINES.**



High Pressure Boilers. Complete Power Plants.

Estimates and Drawings Submitted.

WESTON ENGINE CO., PAINTED POST, N. Y.

REPRESENTATIVES.

# MONOCYCLIC SYSTEM

OF

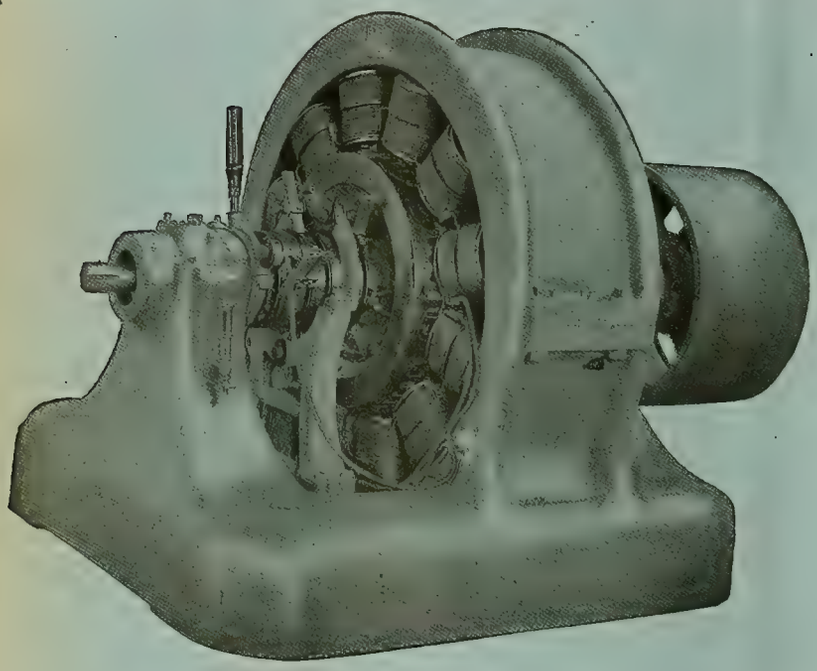
# ELECTRICAL DISTRIBUTION.

## A COMPLETE LIGHT AND POWER

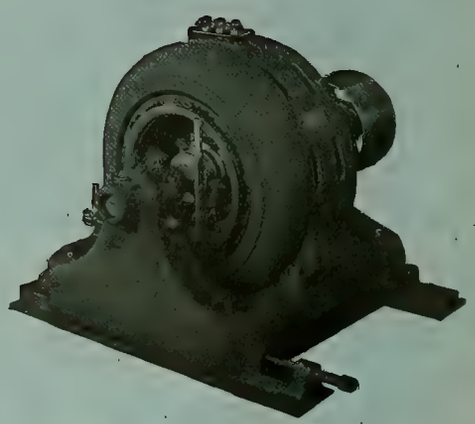
## Central Station

IN

## A Single Alternating Generator.



The Monocyclic Generator (150 K. W.)



The Induction Motor, 20 H. P.

**For Power Purposes equal to a Polyphase System, with all the Simplicity and Advantages of the Single Phase System.**

Generators will carry full load in lights or motors or any proportion in lights and the rest in motors.

**THERE CAN BE NO UNBALANCING.**

Induction Motors Operated with results equal to those obtained with the Best Direct Current Shunt Motors with the same Efficiency and better Speed Regulation.

***Arc and Incandescent Lighting Circuits Operated on the Single Phase System as from the Ordinary Alternator.***

MAY BE ADAPTED TO SYSTEMS OF SECONDARY MAINS SUPPLIED FROM LARGE TRANSFORMERS.

# GENERAL ELECTRIC COMPANY,

## MAIN OFFICE, SCHENECTADY, N. Y.

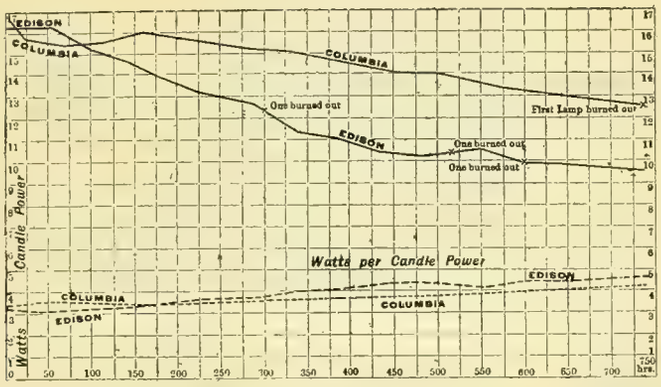
# THE TEST

**Below demonstrates that if Edison lamps are worth 15 cents, Columbia Lamps are worth 45 cents. The present selling price of Columbia Lamps is 20 cents, therefore the present selling price of Edison lamps should be 6 2-3 cents. At the relative difference in price, does it pay to use the cheaper lamp?**



**COMPARATIVE TESTS OF COLUMBIA AND NEW TYPE EDISON LAMPS.**
**NUMBER OF LAMPS STARTED: COLUMBIA, 4; ALL BURNING AFTER 730 HOURS.**
**EDISON, 5; ONLY TWO BURNING AFTER 600 HOURS.**

This test is respectfully referred to "the largest user of incandescent lamps in this country," who recently stated "that the new type Edison lamp equals or surpasses, as to life, sustained candle power and all other features, any lamp burned at the same economy."

Attention is invited to the rapid diminution in candle-power of the Edison lamp and the corresponding increase in watts consumed. After 175 hours, where the number of watts consumed by both lamps was the same, the Edison yields 14 candles in illumination, the Columbia 16. After 300 hours' test an Edison lamp burns out and the remaining Edison lamps give but 12 1-2 candles, while the Columbia lamps give 15 1-4 candles. At 500 hours the difference in favor of the Columbia is as 14 is to 10 1-3, with a saving of nearly one watt per candle power in economy. At 530 hours, and again at 600 hours, an Edison lamp burns out, but not until after 736 hours have passed does the *first* of the Columbia lamps burn out. The candle-power then is: Edison, 9 3 4, to Columbia, 12 3-4, with a saving of .5 watts per candle-power in favor of the Columbia.

That "every other user of Edison lamps (does not) concur" in the statement of the largest user, is best shown by the orders for Columbia lamps received from Edison stations.

If the Columbia lamp is dead and should be thrown out at 750 hours, the Edison lamp is dead and should be discarded at 250 hours. Therefore, it would require three Edison lamps to equal one Columbia lamp. The price of Columbia lamps is 20 cents each, therefore, the price of Edison lamps should be 6 2-3 cents each Lamps carried in stock at branch offices.

## Making History

.....was what we were doing when we brought out the new Standard arc lamp. We admit that other arc lamps may be suitable for Noah's ark, but you and I desire only the latest, the best; for we are keeping pace with the onward march through the opening doors of the twentieth century and have no time to waste on antiquated, crude and complicated mechanisms. It's simplicity, efficiency, perfection, that talk to-day. Cost of maintenance is a more powerful factor with the shrewd buyer than low first cost. Our book is mailed free. Tells the whole story.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.
Colored Glass Insulators to designate different currents.

**WORK ON SPECIAL DESIGNS A FEATURE.**

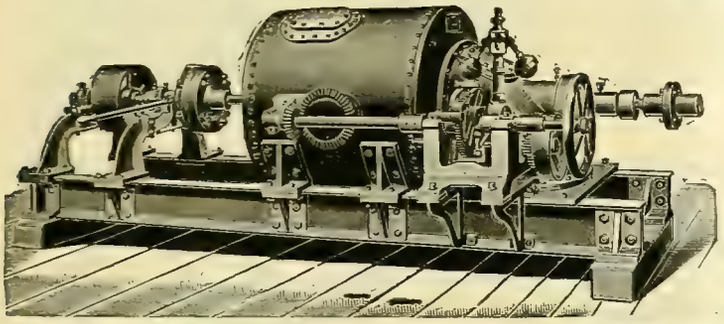
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter,** being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

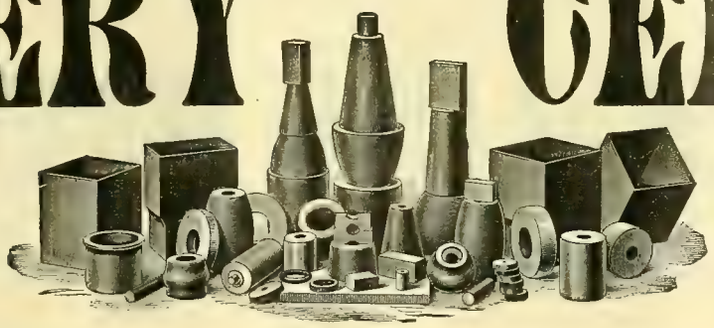
# THE FREEMAN

# BATTERY CELLS.

Estimates Furnished on Application. Prompt Delivery.



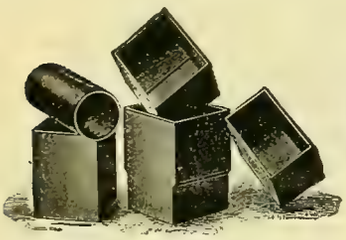
Standard Sizes Always on Hand.

The composition used in the manufacture of these battery cells makes them positively acid-proof, which result has never before been accomplihsed providing additional strength to such an extent that this cell can be used where no other would be practical.

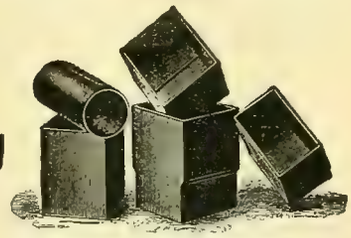
## THESE CELLS ARE A NEW PRODUCTION AND FULLY GUARANTEED.

**AGENTS WANTED IN ALL CITIES.** **WRITE US FOR INFORMATION AND CATALOGUE.**

THE



# Newton Rubber Works,



Newton Upper Falls, Mass.

# The S. K. C. Two Phase Alternating Current System.

**THE FIRST AND ONLY COMPLETE AND PERFECTED SYSTEM BY WHICH LIGHT AND POWER CAN BE SUPPLIED FROM THE SAME GENERATOR AND CIRCUITS. POWER TRANSMISSION AND DISTRIBUTION MADE PRACTICAL AND COMMERCIALLY SUCCESSFUL.**

## POINTS OF SUPERIORITY:

Our system is much more simple and consequently more durable than any other, either direct or alternating.

Our generator is much more efficient than any other alternator, requires less attention and absolutely no supplies except lubricant for bearings.

It is practically self-regulating without the loss of energy involved by compounding or compensating. Other multi-phase machines require a balance of load.

We have entirely eliminated from our generators the usual sources of trouble, expense and interruption of service: i. e, the revolving armature, commutator, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to the high voltages required for power transmission work; in latter case doing away with the expense and loss of step-up transformers; the usual central station machine can be connected at will for either 1,000 or 2,000 volts.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in uniformity of speed under different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

**Patents**—**Our apparatus is novel, different from anything heretofore made, and covered by patents that fully protect us and our customers. We are not infringing patents belonging to others, and shall avail ourselves of the patents under which we operate to protect ourselves from piracy by other manufacturers.**

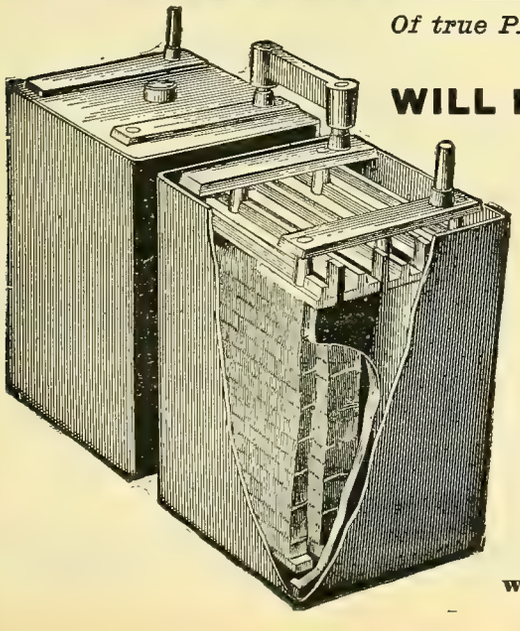
# STANDARD PLANTE STORAGE BATTERIES

*Of true PLANTE Type and CRYSTALLINE FORMATION.*



Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

**CHALLENGE:** We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

# YOU NEED THESE BOOKS.

## NEW DYNAMO TENDERS' HAND-BOOK.

By Lieut. F. B. Badt.

READY FOR DELIVERY.
AN ENTIRELY NEW WORK.

The latest addition to our famous "Hand-Book" Series. Every practical dynamo man should have a copy.

***226 Pages. 138 Engravings.***

**PRICE, $1.00.**

## INCANDESCENT WIRING HAND-BOOK.

By Lieut. F. B. Badt.

**Fourth Edition. Tenth Thousand.**

These tables give, without loss of time, exact size of wire to be used. This is one of our famous "Hand-Book" series, and is the standard authority on this subject in the English language.

**72 Pages. 42 Illustrations.**

**PRICE, $1.00.**

## BELL HANGERS' HAND-BOOK.

By Lieut. F. B. Badt.

Designed for practical men engaged in any class of bell or annunciator work. The only book of the kind published.

106 Pages. 97 Illustrations.

**PRICE, $1.00.**

## ELECTRIC TRANSMISSION HAND-BOOK.

By Lieut. F. B. Badt.

A new work containing tables and information on the electric transmission of power brought down to date. One of the most popular of our famous "Hand-Book" Series.

97 Pages. 22 Illustrations.

**PRICE, $1.00.**

## STREET RAILWAYS.

**"TRAMS."**

***Their Construction, Operation and Maintenance.***

By C. B. Fairchild.

This work is written by a practical man, and should be in the hands of every street railway employe in the United States.

*500 Pages. Profusely Illustrated.*

**PRICE, $4.00.**

## DYNAMO ELECTRIC MACHINERY.

By S. P. Thompson.

Fourth edition, revised and re-written. The most complete work on the dynamo published.

900 Pages. Fully Illustrated.

**PRICE, $9.00.**

## DICTIONARY ... OF ... ELECTRICAL WORDS,

**TERMS AND PHRASES.**

By Edwin J. Houston, A. M.

The latest edition of this celebrated work contains over 5,000 distinct definitions. As important as Webster.

**700 Pages. 750 Illustrations.**

**PRICE, $5.00.**

## THE ELECTRIC MOTOR AND ITS APPLICATIONS.

By Martin and Wetzler.

The first American book on electric motors. A most complete work brought down to date.

325 Pages. 354 Illustrations.

**PRICE, $3.00.**

## *THE PRACTICAL MANAGEMENT* OF DYNAMOS AND MOTORS.

By Crocker and Wheeler.

The object of this work is to give *simple* directions for the practical use and management of dynamos and motors. This work is having a large sale.

100 Pages. Fully Illustrated.

**PRICE, $1.00.**

## ELECTRIC LIGHT SPECIFICATIONS FOR THE USE OF Engineers and Architects.

By E. A. Merrill.

This work gives the latest rules of The National Electric Light Association, of the National Board of Fire Underwriters, and of The New England Insurance Exchange.

***176 Pages.***

**PRICE, $1.50.**

## THE ELECTRIC RAILWAY IN THEORY AND PRACTICE.

By Crosby and Bell.

This is a complete treatise on the construction and operation of electric railways, and will commend itself to the electrical engineer, and to the practical manager.

*400 Pages. Profusely Illustrated.*

**PRICE, $2.50.**

## HIGH POTENTIAL AND HIGH FREQUENCY.

***Experiments with Alternate Currents.***

By Nikola Tesla.

A lecture delivered before the Institution of Electrical Engineers, London.

146 Pages. Fully Illustrated.

**PRICE, $1.00.**

## THE ELECTRIC TELEGRAPH.

By F. L. Pope.

The fourteenth edition of this celebrated work is rewritten and brought down to date. A technical hand-book for electricians, managers and operators.

234 Pages. Illustrated.

**PRICE, $1.50.**

## SCIENCE SERIES.

The series now numbers 103 volumes, and embraces works on every subject.

**16 mo. Boards.**

PROFUSELY ILLUSTRATED.

**Price, 50c. Each.**

## STANDARD ELECTRICAL DICTIONARY.

By T. O'Connor Sloane.

This new work should be in the hands of all who desire to keep abreast with the progress of the greatest science of the times.

600 Pages, 300 Illustrations.

**PRICE, $3.00.**

Any of the above books sent promptly, postage prepaid, on receipt of price.

## CHICAGO SHORTHAND INSTITUTE, 35th St. and Wabash Ave.
**A Central School of Shorthand and Typewriting of the most Modern and Complete Type.**

**A COMPLETE COURSE OF SHORTHAND.** We offer you shorthand instructions in abundance, and most excellent in quality. Our course is graded and arranged in logical order. We claim not a new system, but a new method of imparting the art of shorthand by which we can equip any ordinary intelligent person for the execution of any stenographic work devolving upon the expert stenographer or court reporter.

The method of instruction employed is practical and progressive. The principles are taken up and explained in an orderly manner, and the student directed how to apply them correctly in the work of forming the characters rapidly and artistically. You may have access to the quintessence of the standard systems—Pitman, Munson, Graham. We guarantee to turn you out a full-fledged stenographer capable of any kind of stenographic work. The art is made a specialty.

Tuition, $10.00 per month. Secure class seats immediately.

Evening classes, $5.00 per month. 98 per cent. of our students hold positions.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Test of a 45-inch Wheel—July 9, 1894.

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |
|---|---|---|---|---|---|
| Whole Gate | 16.06 | 119.17 | 141.58 | 205.27 | 79 76 |

### Sleepers Between Chicago and Milwaukee.

The Chicago, Milwaukee & St. Paul Railway is now running sleeping cars with drawing rooms on night trains between Chicago and Milwaukee. Sleepers can be taken in Union Passenger Station any time between 9:30 and midnight, train leaving Chicago at 3:00 a. m., arriving at Milwaukee at 5:15 a. m., passengers remaining in sleeper until 7:30 a. m. Similar arrangements Milwaukee to Chicago. Berth rate $1.50. For further particulars, for tickets and berths, app'y at City Ticket Office, 207 Clark St (Telephone Main 2190), or at Ticket Office, Union Passenger Station.

---

### SHORT JOURNEYS ON A LONG ROAD

Is the characteristic title of a profusely illustrated book containing over one hundred pages of charmingly written descriptions of summer resorts in the country north and west of Chicago. The reading matter is new, the illustrations are new, and the information therein will be new to almost everyone.

A copy of "Short Journeys on a Long Road" will be sent free to anyone who will enclose ten cents (to pay postage) to GEO. H. HEAFFORD, General Passenger Agent Chicago, Milwaukee & St. Paul Railway, Chicago, Ill.

# WESTINGHOUSE ELECTRIC & MFG. CO.,

## PITTSBURG, PA.

Our new Factory at East Pittsburg is now completed and our facilities for manufacturing electrical apparatus for lighting and power purposes of all kinds are unsurpassed. We have made important additions to our equipment of machine tools, and are prepared to maintain, and even strengthen, the recognized reputation of the Company for excellence of mechanical design and construction, combined with the highest electrical efficiency.

We are the sole owners of the Tesla Polyphase System of electrical power transmission—the only practical and economical method in successful operation. This system is used to drive the machinery in our new works, where inspection of its workings is invited. It is the system adopted by the Cataract Construction Company for the great plant at Niagara Falls.

We are the pioneers of the alternating current system of central station incandescent and arc lighting in America,—a result largely due to the excellent mechanical design and construction of our apparatus.

In electric railway work the superiority of our multipolar generators, improved motors and controllers, and general power station apparatus, is recognized by the owners and managers of the most successful electric railways.

Our manufacture of smaller electrical appliances, such as Converters, Shallenberger Meters, Sawyer-Man Incandescent Lamps, Fan Motors, Direct Current Stationary Motors, Wurts Non-Arcing Lightning Arresters, Ammeters, Voltmeters, Cut-outs, Circuit Breakers, etc., etc., is recognized as standard throughout the electrical trade.

**New Orleans, 1010 Canal St.**

Kansas City, Mo., **Gate City Electric Co.**

## Energy.

It is the envious cry of the weak and irresolute that this or that one is "lucky." There is no such thing as luck. Emerson once said that this world belongs to the energetic, and he expressed a profound truth. Energy has accomplished ends that so called genius despaired of. Energy made Grant and Napoleon great generals. Where others hesitated, vacillated and lost, they achieved success by prompt action and energy. There is little in Napoleon's character worthy of emulation except his tireless and indomitable energy. He was avaricious, conscienceless and unprincipled, but his energy was of that temper which creates empires, founds governments and sweeps opposition to the four winds. Each of these, otherwise plain and simple men, planned with an audacity that accepted nothing as insuperable; they executed their plans with energy. It is this which marks the distinction between the successful and the unsuccessful man. This quality will accomplish any end, and no amount of "luck" or "genius" will do it without.—Hezekiah McGruder.

All government, indeed every human benefit and enjoyment, every virtue, and every prudent act, said Edmund Burke, is founded on compromise and barter. We balance inconveniences; we give and take; we remit some rights that we may enjoy others; and we choose rather to be happy citizens than subtle disputants. As we must give away some natural liberty, to enjoy civil advantages; so we must sacrifice some civil liberties, for the advantages to be derived from the communion and fellowship of a great empire. But, in all fair dealings, the thing bought must bear some proportion to the purchase paid.

### A "JINER" IN THE SURF.

You probably remember the story told in verse of the old lady, who, when asked the occupation of her husband, replied that he was a "jiner," because his entire time was taken up in "jining" secret societies, writes the Rambler of the New York Mail and Express.

The people who know Dr. David S. Skinner in Brooklyn—that is, the folks who are intimate enough with him to presume on such a familiarity—say that he is the champion "jiner" of the country, because he is a member of thirty-one secret societies, and next week he will be a member of thirty-two, because, after much persuasion, he has been induced to join the Masonic Veterans' Association, which, as its name describes, is composed of veterans in the masonic order. Dr. Skinner has taken his thirty-second degree, and has been a free mason for twenty-five years or more, which qualifies him for admission.

—o—

It is natural to suppose that a man who holds membership in such an unusually large number of secret organizations would either forget some of the signs, grips, or pass-words or get them confused, and that is just what has happened to the doctor on numerous and divers occasions.

The divers occasion was last summer when he went down to Manhattan Beach for a dip. He saw a fat, florid gentleman far out beyond the breakers making certain motions which Dr. Skinner at first took to be masonic signals of distress. He swam out to render assistance, and when he got within speaking distance the fat man suddenly made several movements indicating that he belonged to the Order of the Seven Wise Men. Before the doctor had time to swim half a dozen yards more the other swimmer made known with great rapidity that he was a Knight of Pythias, an Odd Fellow, a Mystic Shriner and one of the Sons of Rest.

"Trying to beat my record," said Dr. Skinner, blowing a shower of salt water from his mouth, and getting his hands above the surface of the water, "I guess I'll see how much that chap knows." And he gave him the grand hailing sign of the Red Men, the Knights of the Golden Eagle, the Order of the Golden Chain and the Knights of Honor.

—o—

Thereupon the fat man turned over on his back and began signaling with great rapidity. He told in pantomime that he was one of the Order of Druids, a Forester, a Knight of Maccabees, a son of the Legion of Justice, an American Mechanic, a past grand worthy companion of the Home Circle, an Elk, and one of the Sons of America.

"Great Scott!" said Dr. Skinner, "I wonder what I've struck? I'll make another effort at him anyway," and he gave the signs of fourteen other orders so fast that he had to tread water to keep himself afloat. "I guess that will settle him," he remarked, but it didn't. The fat man let himself sink, held his hands above the water and worked off seventeen more separate and distinct signs of that many societies. "I'm through," remarked Dr. Skinner, as he turned to swim ashore, "I guess that fellow is a past master of the Concentrated Order of Everything."

# DAYTON ELECTRIC CEILING FANS

For 110, 220, 250, 500 Volts D. C. and Arc Circuits.

Give absolute satisfaction.
They are a pronounced success in every detail.
If you want the best, send us your orders for

THE DAYTON.

## OUR FAN MOTORS

For 500 Volt and Arc Circuits are Perfect.

We have a large stock on hand and can fill your orders without delay,

## ALTERNATING FAN MOTORS.

We have a limited stock of the Ries and Scott Fan Motors on hand. As we are making an exceptionally low price on them, they are going fast. If you are looking for a bargain in this line, we can accommodate you. Send us your orders at once if you wish to take advantage of low price.

THE STEVENS FLUSH SWITCHES,

And General Electrical Work.

Special attention given to the construction of models and inventors' experimental work.

WE CLAIM

**For the Plush Protectors,** simplicity, sure action, ready adjustment, and interchange of parts.
**For the Stevens Flush Switch,** fire and damp proof. Mechanism is simplicity itself. Nothing to get out of order. Make and break so wide that no arc can form. Wired without removing casing. Buttons made of mother of pearl. Base made of vulcabeston with porcelain cases.

Impossible for them to get out of order.

# Will You Be In It? Yes!

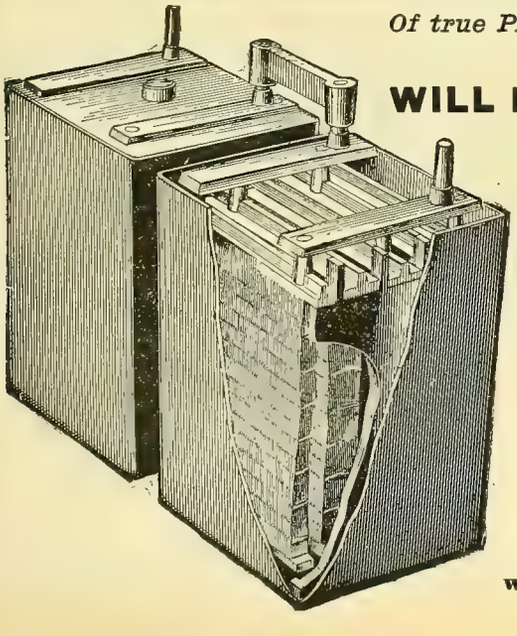
# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

☞ CHALLENGE: We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

INDIANAPOLIS, IND.

### OPPOSITION

is often a blessing in disguise. We started to do a legitimate manufacturing business—to supply better lighting apparatus than could be found on the market. But monopoly said we must stop, or it would crush us. In some characters the fighting spirit is aroused by remarks of that nature. It made us aggressive. We bounded to the front and set the pace for monopoly and to-day we are building the only electric ighting system that is perfect mechanically, efficient electrically.

Read our book; it tells the whole story. Free to you.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems,
Colored Glass Insulators to designate different currents.

**WORK ON SPECIAL DESIGNS A FEATURE.**

Send Model or Drawing and we will furnish estimates.

## HEMINGRAY GLASS CO.,

THE

# "CLARK" WIRE.

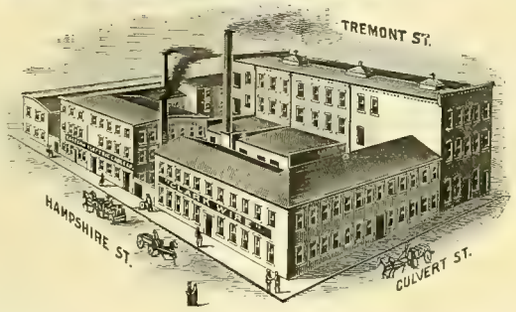
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**BRANCH OFFICE:**

1649, 1650, 1651 MONADNOCK BLDG.,
CHICAGO, ILLINOIS.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

# *Siemens & Halske Electric Company of America,*

*Siemens & Halske. Berlin, Charlottenburg, Vienna, St Petersburg.*

MANUFACTURERS OF

# DIRECT CURRENT SLOW SPEED MULTIPOLAR GENERATORS AND MOTORS.

These machines are constructed with **external armatures.** They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow speed machines, made for direct-connection in sizes from 20 H. P. to 2000 H. P.

**Advantages of our External Armature Type.** Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding on armature. Lowest internal resistance of Armature. Only three to four volts difference of potential between commutator bars. Greatest weight of copper per ampere of current. Greatest radiating surface possible. Maximum magnetic effect. Armatures cannot burn out. Great compactness. Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.) Finest quality of iron, excellent finish, absence of binding wire. **In 8 years' continuous service not one armature has been replaced or repaired.**

**OVER 200,000 H. P. IN USE for Railway, Lighting and Motor Service.** World's Fair Diploma and Medal for **best** direct-connected Generator.

## MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

With Siemens Drum Armatures, which are copied extensively in this country. We are building these machines in sizes from 1 H. P. to 150 H. P.

## Continuous Current Dynamos and Motors:

THEIR THEORY, DESIGN, AND TESTING.

With Sections on Indicator Diagrams, Properties of Saturated Steam, Belting Calculations, Etc.

AN ELEMENTARY TREATISE FOR STUDENTS.

By FRANK P. COX, B.S.

Cloth. 271 Pages, 83 Illustrations. Price $2.00.

Intended for students, this work gives the theory and design of continuous current dynamos and motors as understood and practiced in the designing-room, and the methods of testing described are those of the factory testing-shop. The practical side of the various questions treated is always kept in view, discussions having little bearing in this direction being excluded, and the higher branches of mathematics avoided. The application to the design of armatures, field-magnets and motors of the principles developed is explained by reference to numerical problems, thus thoroughly impressing them on the student's mind. Methods of testing a complete machine and of investigating its characteristics are given, with discussions on the effect of various changes in design and operation. The steam-engine being so closely allied to the testing and operation of dynamos and motors, sections on indicator diagrams, steampower calculations, and belting are included. Almost all of the numerous curves in the book are derived from actual commercial tests.

CONTENTS.

Chapter I. The Absolute System of Measurement.—Chapter II. Electro-Magnetic Induction.—Chapter III. Classification of Machines and General Principles of the Magnetic Circuit.—Chapter IV. The Dynamo as a Motor.—Chapter V. Calculations Pertaining to the Magnetic Circuit.—Chapter VI. Theory of Windings, Losses, etc.—Chapter VII. The Dynamo Considered as a Motor.—Chapter VIII. # VICTOR TURBINE WATER WHEEL.

Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter**, being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases**. Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS,

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Stickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

THE PHOSPHOR BRONZE SMELTING CO. LIMITED
2200 WASHINGTON AVE. PHILADELPHIA, PA.

ORIGINAL MANUFACTURERS OF PHOSPHOR-BRONZE IN THE UNITED STATES AND SOLE MAKERS OF "ELEPHANT BRAND" PHOSPHOR-BRONZE.

# WESTINGHOUSE ELECTRIC & MFG. CO.,

## PITTSBURG, PA.

Our new Factory at East Pittsburg is now completed and our facilities for manufacturing electrical apparatus for lighting and power purposes of all kinds are unsurpassed. We have made important additions to our equipment of machine tools, and are prepared to maintain, and even strengthen, the recognized reputation of the Company for excellence of mechanical design and construction, combined with the highest electrical efficiency.

We are the sole owners of the Tesla Polyphase System of electrical power transmission—the only practical and economical method in successful operation. This system is used to drive the machinery in our new works, where inspection of its workings is invited. It is the system adopted by the Cataract Construction Company for the great plant at Niagara Falls.

We are the pioneers of the alternating current system of central station incandescent and arc lighting in America,—a result largely due to the excellent mechanical design and construction of our apparatus.

In electric railway work the superiority of our multipolar generators, improved motors and controllers, and general power station apparatus, is recognized by the owners and managers of the most successful electric railways.

Our manufacture of smaller electrical appliances, such as Converters, Shallenberger Meters, Sawyer-Man Incandescent Lamps, Fan Motors, Direct Current Stationary Motors, Wurts Non-Arcing Lightning Arresters, Ammeters, Voltmeters, Cut-outs, Circuit Breakers, etc., etc., is recognized as standard throughout the electrical trade.

# Westinghouse Electric and Manufacturing Company,

## PITTSBURG, PA.

## Commercial Electrical Supply Co.,

Manufacturers and Dealers in All Kinds of

ELECTRICAL SUPPLIES,

**Telephone 4152.** **821 Pine Street.**

ST. LOUIS, AUG. 1st, 1895.

## GREETING.

To The ELECTRICAL FRATERNITY.

Gentlemen:-The management and control of the COMMERCIAL ELECTRICAL SUPPLY COMPANY has been changed, the Messrs. Einstein, who heretofore held the control of this Company, having disposed of their entire interest in the same to Mr. Jos. Franklin and his son, Mr. Jos. Franklin, Jr.

The present officers of the Company are, Jos. Franklin, Jr., President and Jos. Franklin Secretary and Treasurer.

The New management wish to thank all their customers for their past favors, and hope, by their increased facilities, to extend their business through a greater territory, bearing in mind that good material, prompt shipment and low prices will always gain trade.

Soliciting your patronage, we remain,

Yours most respectfully,

COMMERCIAL ELECTRICAL SUPPLY CO.

---

## TO MANUFACTURERS.

Space, light, heat and power **FREE** at ***Matthews, Grant County, Ind.,*** to concerns that employ a limited number of men. Ample railroad facilities, healthy location, good schools, improved streets, electric lights, etc. Address GEO. N. CATTERSON, Treas., 24 Kentucky Ave., Indianapolis, Ind.

# Pharos Incandescent Lamps.

The success of the **Pharos Lamp** has not been the result of extravagant laudation or plethoric advertising. It is rather the legitimate outgrowth of the careful attention given to perfecting the details of manufacture, and in practical ways endeavoring to construct a lamp which would return a profit to the purchaser. We have not assumed that you are in business for your health.

OKONITE IT NEVER DISAPPOINTS

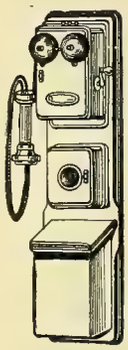
And all parts of Telephones. Special prices on large lots.

*Send for Catalogue.*



**MIANUS ELECTRIC CO., - Mianus, Conn.**

# The S. K. C. Two Phase Alternating Current System.

THE FIRST AND ONLY COMPLETE AND PERFECTED SYSTEM BY WHICH LIGHT AND POWER CAN BE SUPPLIED FROM THE SAME GENERATOR AND CIRCUITS. POWER TRANSMISSION AND DISTRIBUTION MADE PRACTICAL AND COMMERCIALLY SUCCESSFUL.

## POINTS OF SUPERIORITY:

Our system is much more simple and consequently more durable than any other, either direct or alternating.

Our generator is much more efficient than any other alternator, requires less attention and absolutely no supplies except lubricant for bearings.

It is practically self-regulating without the loss of energy involved by compounding or compensating. Other multiphase machines require a balance of load.

We have entirely eliminated from our generators the usual sources of trouble, expense and interruption of service: i. e., the revolving armature, commutator, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to the high voltages required for power transmission work; in latter case doing away with the expense and loss of step-up transformers; the usual central station machine can be connected at will for either 1,000 or 2,000 volts.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in uniformity of speed under different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

**Patents**—Our apparatus is novel, different from anything heretofore made, and covered by patents that fully protect us and our customers. We are not infringing patents belonging to others, and shall avail ourselves of the patents under which we operate to protect ourselves from piracy by other manufacturers.

TELEPHONES SENT ON TRIAL.
UNIVERSAL TELEPHONE CO.
INDIANAPOLIS, IND.

## Two Kinds:

There are always two kinds of most everything, even of electric lighting apparatus. The good kind—the Standard that the other kind is measured by—and the other kind. Sometimes the latter's first cost is the highest, though not always, and then there are many bills for repairs, burnt out armatures, etc. But it is not that way with the Standard.

Why not buy the best at the start? It's usually the most profitable way. For the Standard system of arc and incandescent lighting is perfect mechanically, efficient electrically.

STANDARD ELECTRIC COMPANY,
205 La Salle, Cor. Adams St., Chicago.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.
Colored Glass Insulators to designate different currents.

WORK ON SPECIAL DESIGNS A FEATURE.

Send Model or Drawing and we will furnish estimates.

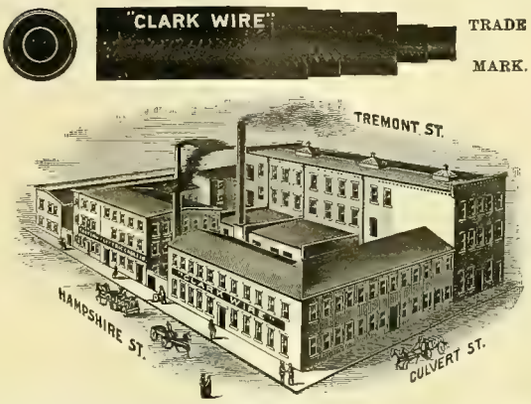
For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**BRANCH OFFICE:**

1649, 1650, 1651 MONADNOCK BLDG.,
CHICAGO, ILLINOIS.



TRADE MARK.

**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

## LOCATIONS FOR INDUSTRIES.

The name of the Chicago Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The Company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns and operates 6,168 miles of Railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota, and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of a territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this Company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway, makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address,

**LUIS JACKSON,**
Industrial Commissioner, C. M. & St. P. R'y,
425 Old Colony Building, CHICAGO, ILL.

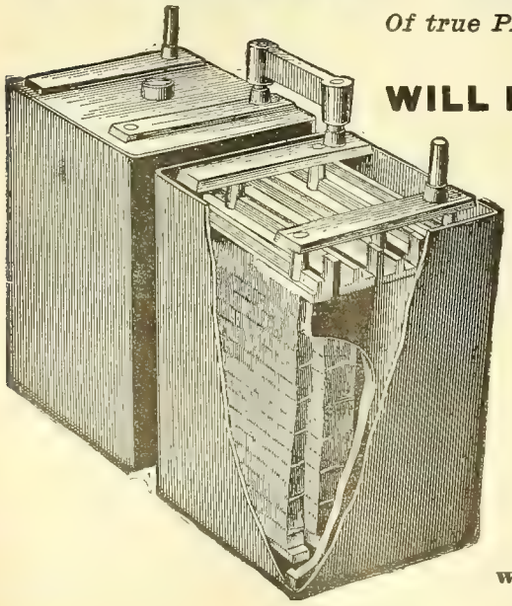
# STANDARD PLANTE STORAGE BATTERIES

*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.



**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

**CHALLENGE:** We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Stickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | Per Cent |
|---|---|---|---|---|---|

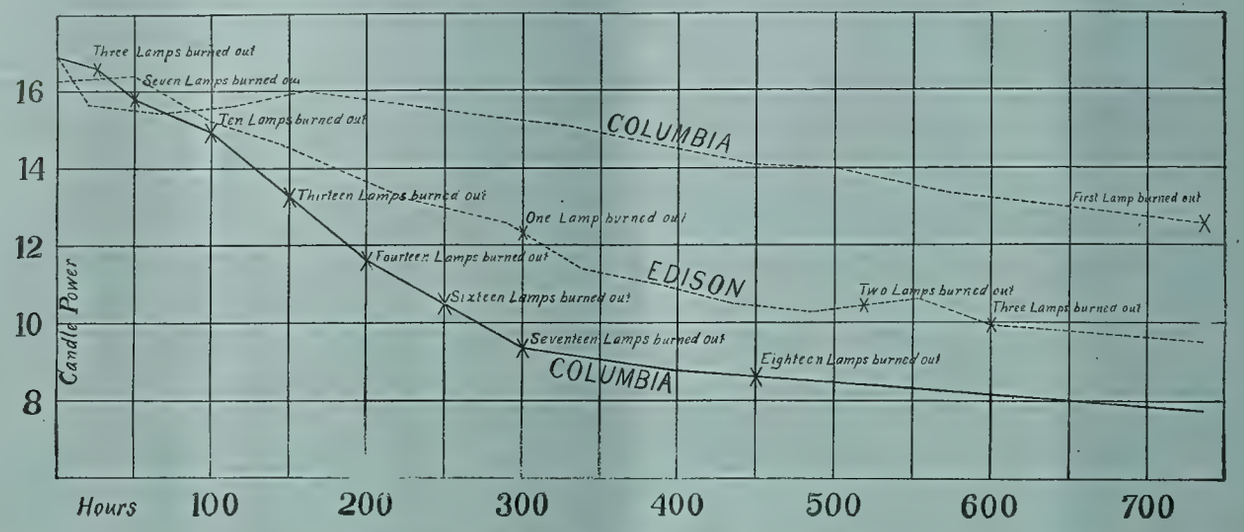
# THE TEST BELOW,

Showing curves in broken lines on FOUR Columbia and FIVE Edison lamps, is a copy of curves recently published by the Columbia Company. The lower curve, represented by a continuous line, is the result of a test made by us on THIRTY-FOUR Columbia lamps, starting at an initial economy of 3.1 watt per candle, the voltage being maintained constant throughout their life. The lamps, being taken from sample lots purchased recently in all parts of the country, should show the AVERAGE RESULT which would be obtained from the REGULAR PRODUCT of the Columbia Company.



**NOTE THE DEADLY PARALLEL!!**

In the COLUMBIA COMPANY'S test only 20 per cent. of FIVE Edison lamps had burned out at 300 hours.

In the EDISON COMPANY'S test 50 per cent. of THIRTY-FOUR Columbia lamps had burned out at 300 hours.

The DROP IN CANDLE POWER and CONSEQUENT INCREASE IN WATTS PER CANDLE of the COLUMBIA LAMPS speaks for itself.

To insure the quality of their product, expensive continuous tests are run by the EDISON GENERAL ELECTRIC COMPANY'S LAMP WORKS on each day's product, and also on the product of all companies manufacturing lamps, either in this country or Europe. SIMILAR TESTS ARE A NECESSITY TO MAINTAIN A UNIFORM QUALITY. NEW TYPE EDISON LAMPS purchased in the open market will, at the same voltage and economy, surpass results which can be obtained with any make of incandescent lamps as regards LIFE and HOLDING UP IN CANDLE POWER.

If prices quoted you on NEW TYPE EDISON lamps are not satisfactory, we can furnish at lower prices our "CRESCENT" lamps, which are equal in quality to any lamps in the market.

Our daily output having been largely increased by reason of great increase of orders, until such output is greater than the combined production of all other lamp factories in this country, we are enabled to quote our present low prices for the BEST LAMP WHICH HAS EVER BEEN PRODUCED BY ANY MANUFACTURER.

**NEW TYPE EDISON LAMPS ARE, AND WILL BE MAINTAINED, THE STANDARD OF QUALITY REGARDLESS OF PRICE.**

For information and prices of NEW TYPE EDISON or CRESCENT lamps, address any of our sales offices given below, or Manager Lamp Sales,

## Commercial Electrical Supply Co.,

Manufacturers and Dealers in All Kinds of

ELECTRICAL SUPPLIES,

**Telephone 4152.** **821 Pine Street.**

ST. LOUIS, AUG. 1st, 1895.

## GREETING.

To The ELECTRICAL FRATERNITY.

Gentlemen:-The management and control of the COMMERCIAL ELECTRICAL SUPPLY COMPANY has been changed, the Messrs. Einstein, who heretofore held the control of this Company, having disposed of their entire interest in the same to Mr. Jos. Franklin and his son, Mr. Jos. Franklin, Jr.

The present officers of the Company are, Jos. Franklin, Jr , President and Jos Franklin Secretary and Treasurer.

The New management wish to thank all their customers for their past favors, and hope, by their increased facilities, to extend their business through a greater territory, bearing in mind that good material, prompt shipment and low prices will always gain trade.

Soliciting your patronage, we remain,

Yours most respectfully,

COMMERCIAL ELECTRICAL SUPPLY CO.

---

## TO MANUFACTURERS.

Space, light, heat and power **FREE** at ***Matthews, Grant County, Ind.,*** to concerns that employ a limited number of men. Ample railroad facilities, healthy location, good schools, improved streets, electric lights, etc. Address GEO. N. CATTERSON, Treas.,
24 Kentucky Ave., Indianapolis, Ind.

# MID-SUMMER THOUGHTS.

It is difficult at times, (this is one of the times) to assemble the evanescent, jagged thoughts into a coherent chain and weave them into a web of definite statement.

Every user of Okonite Wire—spite of all effort the mind wanders, escapes the toil of thinking, and jilts you. It is the season of year when the "feesh" invite you with every wibbly waggle of their gleaming tails, and the ol' swimmin' hole lures you with its placid coolness.

Interior Conduit has re—and it's just the kind of weather when it's more than pleasant to lie in the fragrant clover of the old orchard, under the golden-russet tree, and listen—listen to the droning hum of a bumble bee—listen to the woodpecker drum the pear-tree bole, and watch the doodle-bug scamper to his near-by hole—and a silver thread from a spider web floats between your drowsy eyes. Across the pasture, athwart the corn, sings the note of the dinner horn—a perfume sweet of shocked-up wheat—and Aunt Belinda's pies.

The Pharos Incandescent Lamps—we give it up—incorrigible!

## Central Electric Company,

**173-175 Adams St.,**

**CHICAGO.**

SAINT LOUIS—NEW ORLEANS—KANSAS CITY.

# DAYTON ELECTRIC CEILING FANS

## A Splended Victory

Was won when the new Standard Arc Lamp was placed on the market. A victory over obsolete patterns and crude, cumbersome and complicated mechanism. For no lamp is so simple in operation, so easily kept in order, so perfect mechanically, so efficient electrically, or so moderate in price, good qualities considered. To discard your old lamps and purchase the new is excellent economy. Interest on investment is more than offset by lessened cost of maintenance, to say nothing of increased service. That book of ours shows why; mailed free.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems,
Colored Glass Insulators to designate different currents.

**ELECTRICIAN PUBLISHING COMPANY,**
**6 Lakeside Building, Chicago.**

## LOCATIONS FOR INDUSTRIES.

The name of the Chicago Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The Company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns and operates 6,168 miles of Railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota, and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of a territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this Company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway, makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address,

**LUIS JACKSON,**
Industrial Commissioner, C. M. & St. P. R'y,
425 Old Colony Building, CHICAGO, ILL.

## IMPERIAL DRY BATTERY.

The Imperial Dry Battery is Mr. Wm. Burnley's latest and improved Dry Battery, and superior in every respect to his first, or the old "Burnley Dry" Battery.

We are the only firm manufacturing his latest battery. All batteries are made under Mr. Burnley's personal supervision. We are the pioneers in the making of successful dry batteries and have had more experience in this line than any other concern in the country.

When you buy the Imperial you have the satisfaction of knowing that they are made by the original dry battery manufacturers and guaranteed to be the best on the market.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases**. Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

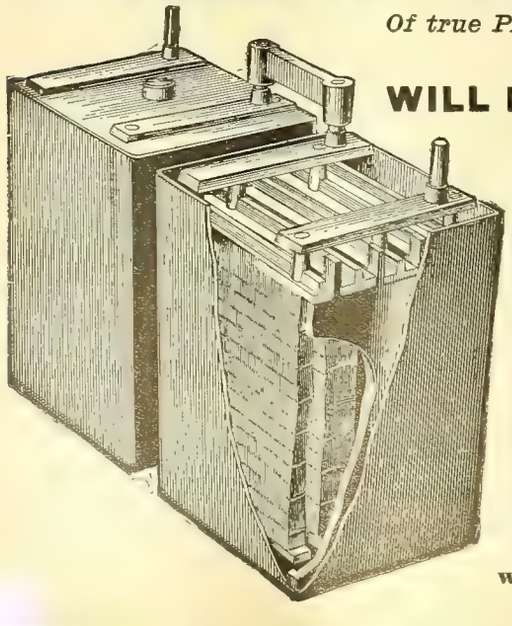
# STANDARD PLANTE STORAGE BATTERIES

*Of true PLANTE Type and CRYSTALLINE FORMATION.*



Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

**CHALLENGE:** We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

# ELECTRICITY FOR ENGINEERS.

New Edition, Just Out! Now Published in One Complete Volume, 424 Pages, Profusely Illustrated.
Just the Work for Engineers, Electricians, Dynamo Tenders, etc.

**PART I. CONTENTS.**—CHAPTER I: Electricity; Positive and Negative; Conductors, Non-Conductors and Insulators; Electro-Motive Force; Volts; Resistance; Ohms; Current; Amperes.—CHAPTER II: Dynamos; Magnets; Field Coils; Electro Magnets; Permanent Magnets.—CHAPTER III: Armatures, Construction of, Different Kinds of; Commutators, How Made and Connected; Heating of Armatures; Eddy Currents.—CHAPTER IV: The Current; How Produced; Induction; Series Wound Dynamos; Shunt Wound Dynamos; Exciting the Fields; Constant Current and Constant Potential Dynamos; Series and Parallel; Parallel or Multiple Arc System.—CHAPTER V: Incandescent Lamps; Filaments; Connections; Flashing; Exhausting; Testing; Candle Power; Operated in Series; Automatic Cut-Out; In Multiple Arc or Parallel; Multiple Series; Multiple Series Cut-Out; Three Wire System.—CHAPTER VI: The Arc Light; How Formed; Causes of Unsteadiness; Remedy; Effect of Shades or Globes; Shape of Carbons under Different Conditions of Burning; Arc Lamps; Regulating and Cut-Out Mechanism; Action of Current; Clutch Lamps; Clockwork Lamps; Double Lamps; Troubles in Lamps.—CHAPTER VII: Commutators and Brushes; The Brush Commutators; Brushes; Different Styles of Brushes; Double Brushes; Single Brushes; Troubles with Commutators and Brushes; Correct Position of Brushes; Sparking at Brushes; Care of Brushes and Commutators; Flashing.—CHAPTER VIII: Current Regulation; Hand Regulation; By Position of Brushes; Resistance Box; Resistance Coils.—CHAPTER IX: American System of Automatic Current Regulation; The Dynamo; Regulator; Action of Regulator.—CHAPTER X: Brush System of Automatic Current Regulation; Brush Armature; Diagram of Circuits through Dynamo, Regulator and Lamps; Dial or Regulator; Care and Adjustment of Dial: Dial Controller; Circuits and Connections of No. 8 Brush Dynamo; Circuits of Compound Wound Constant Potential Brush Dynamo.—CHAPTER XI: The Edison System; Automatic Regulator; Circuits of Regulator; Circuits of Dynamo; Action of Regulator; Howell Pressure Indicator; Diagram of Circuits; Description of Parts and Operation.—CHAPTER XII: Excelsior System of Automatic Current Regulation; Dynamo; Armature; Diagram of Circuits; The Regulator and Motor; Action of Regulator.—CHAPTER XIII; Schuyler System of Automatic Current Regulation; Dynamo; Armature, Commutator and Brushes; Diagram of Circuits in Armature and Field; Regulator; Circuits in Regulator —CHAPTER XIV: Thomson-Houston System of Automatic Current Regulation; Dynamo; Armature; Commutator and Brushes; Controlling Magnet; Wall Controller; Diagram of Circuits; Air Blast.—CHAPTER XV: Waterhouse System of Three-Brush Automatic Current Regulation; Dynamo; Extra Brush; Resistance Coils and Regulator.—CHAPTER XVI: Ampere Meters; Tangential Scale; Solenoid Meters.—CHAPTER XVII: Voltmeters; Pressure and Potential Indicators.—CHAPTER XVIII: Testing; Galvanometers; Astatic Needle; Differential Apparatus.—CHAPTER XIX: Wheatstone Bridge or Electrical Balance; Diagram of Circuits and Methods of Use; Bridge and Rheostat; Round Form; Square Form.—CHAPTER XX: The Magneto as a Testing Instrument; Armature; Field; Bell; Diagram of Circuits.—CHAPTER XXI: Coupling Dynamos Together; In Series; In Shunt; Series, Shunt and Compound Wound Machines.—CHAPTER XXII: Switches and Switchboards; Loop Switch; Plug and Socket; Change Over Plug and Socket; Conclusion. CHAPTER XXIII: Electric Motors, General Principles the Same as in Dynamos; Types; Shunt and Series Motors Suitable for all General Purposes; Regulation of Shunt Motors; Of Series Motors; Counter E. M. F.; Direction of Rotation and Direction of Current; Starting Motors; Diagram of Connection.

**PART II. CONTENTS.**—CHAPTER I: Alternate Current Dynamos; Principles of the Field. Field Current Armature; Winding; Connections; Lamination; Different Types of Alternators; Regulation; Leading Systems; The Brush Generators; Magnets; Armature; Principles of Induction.—CHAPTER II: Dynamos, Continued; The Mordey Alternator; Stationary Armatures; Field Magnets; Ferranti Armature, Field Magnets; Winding; Collectors.—CHAPTER III: Dynamos, Concluded; Siemens Dynamo; Best Magnetic Circuits; Stanley Constant Current Dynamo; The Armature; Self Induction; Regulation —CHAPTER IV: Induction Coils; Converters; Transformers; Economy of Distribution; An Electrical H. P.; Losses in Conductor; Induction Coils; Effect of Induction; Transformers.—CHAPTER V; Transformers, Continued; Induction Coils; Converters; Transforming Up and Down; Design of Transformers; The Static Charge; Protection Against; Grounding the Secondary; Other Devices; The Foil Protector; Different Types of Transformers.—CHAPTER VI: Transformers, Concluded; Fuses; Regulation; Winding of Transformers; Connecting to Circuit; Regulation; Safety Fuses.—CHAPTER VII: Parallel System; Series Arc Light System; Diagram of Circuits; Parallel System; Primary Circuit; Secondary Circuit; Placing of Transformers; Fuses; Diagram of Series Arc Light Circuit —CHAPTER VIII: Lines of Force; Hysteresis; Magnetic Penetration; The Circuit of Lines of Force; Experiments with Magnet; Rapidity of Reversals and Hysteresis.—CHAPTER IX: Arc Lamps; In Series; The Westinghouse Arc Lamp; Diagram of Circuits in Lamp; Action of the Mechanism; Flat Carbons.—CHAPTER X: Arc Lamps, in Multiple; Slattery Differential Lamp; Mechanism of Lamp; Its Operation.—CHAPTER XI: Measuring and Indicating Apparatus; Instruments for Use with Alternating Currents Differ from those used with Continuous Currents; Ammeters; Voltmeters; Description of Several Forms of Instruments.—CHAPTER XII: Measuring Instruments, Continued; Hot Wire Instruments; The Cardew Voltmeter; Details of the Instrument; Low Potential Voltmeter.—CHAPTER XIII: Voltmeters; Double Coil Voltmeter; Two Types.—CHAPTER XIV: Spring Meters; Curled Spring Meter.—CHAPTER XV: Twisted Strip Instruments; Diagram of Connections and Operation of Instrument.—CHAPTER XVI: Recording Meters; Stanley Meter; Construction and Principles of Operation; Diagrams of Parts; Slattery Induction Meter; Description of Parts and Principles of Operation; Watt Meter; Thomson Meter.—CHAPTER XVII: Generators in Parallel; Difficulties in Operating; Alternate Current Generators in Parallel; Arrangements of Circuits and Machines for Operating in Parallel; Diagram of Common Arrangement of Machines and Circuits.—CHAPTER XVIII: Ohm's Law; Strength of Current; Formulas and Examples; Power and Heating Effects of Currents.—CHAPTER XIX: Ground Alarms and Leak Detectors.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.
The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

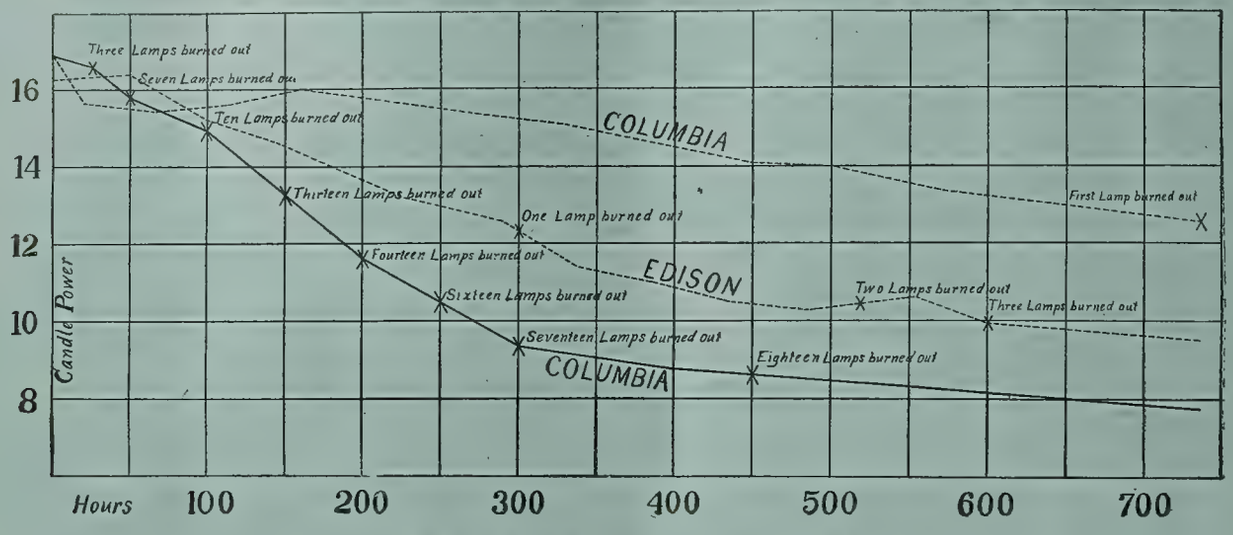
# THE TEST BELOW,

Showing curves in broken lines on FOUR Columbia and FIVE Edison lamps, is a copy of curves recently published by the Columbia Company. The lower curve, represented by a continuous line, is the result of a test made by us on THIRTY-FOUR Columbia lamps, starting at an initial economy of 3.1 watt per candle, the voltage being maintained constant throughout their life. The lamps, being taken from sample lots purchased recently in all parts of the country, should show the AVERAGE RESULT which would be obtained from the REGULAR PRODUCT of the Columbia Company.



**NOTE THE DEADLY PARALLEL!!**

In the COLUMBIA COMPANY'S test only 20 per cent. of FIVE Edison lamps had burned out at 300 hours.

In the EDISON COMPANY'S test 50 per cent. of THIRTY-FOUR Columbia lamps had burned out at 300 hours.

The DROP IN CANDLE POWER and CONSEQUENT INCREASE IN WATTS PER CANDLE of the COLUMBIA LAMPS speaks for itself.

To insure the quality of their product, expensive continuous tests are run by the EDISON GENERAL ELECTRIC COMPANY'S LAMP WORKS on each day's product, and also on the product of all companies manufacturing lamps, either in this country or Europe. SIMILAR TESTS ARE A NECESSITY TO MAINTAIN A UNIFORM QUALITY. NEW TYPE EDISON LAMPS purchased in the open market will, at the same voltage and economy, surpass results which can be obtained with any make of incandescent lamps as regards LIFE and HOLDING UP IN CANDLE POWER.

If prices quoted you on NEW TYPE EDISON lamps are not satisfactory, we can furnish at lower prices our "CRESCENT" lamps, which are equal in quality to any lamps in the market.

Our daily output having been largely increased by reason of great increase of orders, until such output is greater than the combined production of all other lamp factories in this country, we are enabled to quote our present low prices for the BEST LAMP WHICH HAS EVER BEEN PRODUCED BY ANY MANUFACTURER.

**NEW TYPE EDISON LAMPS ARE, AND WILL BE MAINTAINED, THE STANDARD OF QUALITY REGARDLESS OF PRICE.**

For information and prices of NEW TYPE EDISON or CRESCENT lamps, address any of our sales offices given below, or Manager Lamp Sales,

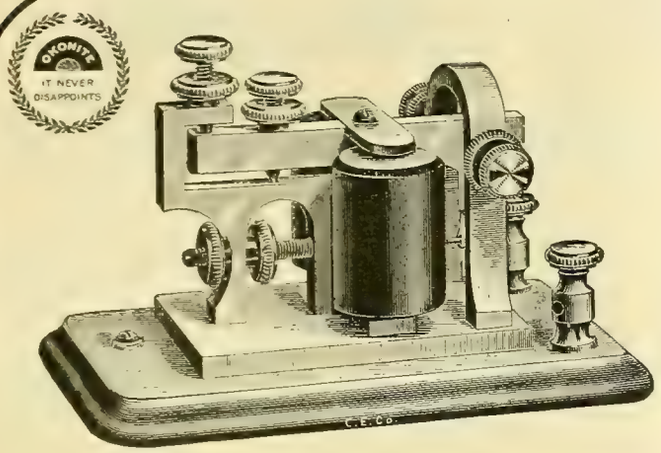
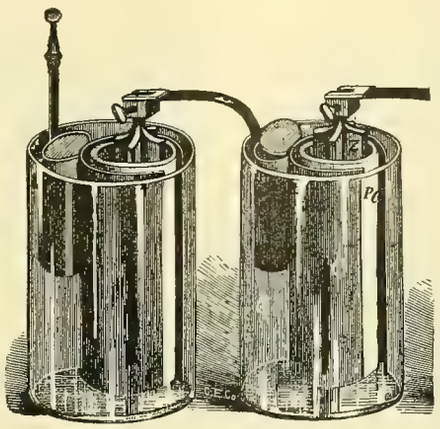
Prompt attention given to all orders.



# Telegraph Instruments,

**Keys, Sounders, Relays, Batteries, Switches, Lightning Arresters and Sundry Supplies.**



We carry in stock a large line of standard goods, ranging from the more expensive regular W. U. types and other patterns, to the cheaper grades intended for experimental and amateur work. Workmanship and finish first-class. We solicit orders for these goods and take the greatest care in sending just what is wanted, at reasonable prices. Material carefully packed for shipment to any distance.

**The Largest Electrical Supply Company in the U. S.**

**General Western Agents: Okonite Wires, Lundell Fans and Motors, Interior Conduit Supplies.**

## Central Electric Company,

**173-175 Adams St.,**

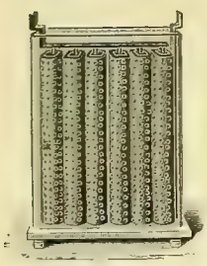
**CHICAGO.**

**St. Louis:** Southern Electrical Supply Co.

**New Orleans:** 1010 Canal Street.

**Kansas City:** Gate City Electric Co.

# The Ohio Storage Battery Company,



**Sole Manufacturers, under Exclusive License, of the Ford-Washburn Storelectro Co.'s Storage Batteries:** The most durable Batteries ever produced. For Street Railways, Lighting Plants, Electric Launches, Electric Carriages, Doctors and Dentists; and for any other work where Storage Batteries can be used.

**SPECIALTIES:** Isolated Plants for house lighting, and cells for surgical, telegraph, telephone and phonographic uses. Small cells made to order. Send for catalogue giving capacities, weights, etc.

**MAIN FEATURES OF THE CELL:** The ability to stand an incessant charge and discharge without any injury, which is an advantage that cannot be exaggerated; the capability of enduring a repeated discharge on a dead short circuit without injury to the cells; the special form of cell which frees IT from the weaknesses that have made other types a failure.

**EASTERN OFFICE: 203 Broadway, New York City. J. A. MACHADO, Agent.**

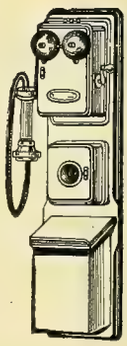
**Magneto Bells.**

Hunnings, Blake and Ball
TRANSMITTERS,
RECEIVERS.

**Telephone Wood Work.**

INDUCTION COILS,
DESK TELEPHONES,
DESK TRANSMITTERS,



And all parts of Telephones. Special prices on large lots.

*Send for Catalogue.*

**MIANUS ELECTRIC CO., - Mianus, Conn.**

# The S. K. C. Two Phase Alternating Current System.

THE FIRST AND ONLY COMPLETE AND PERFECTED SYSTEM BY WHICH LIGHT AND POWER CAN BE SUPPLIED FROM THE SAME GENERATOR AND CIRCUITS. POWER TRANSMISSION AND DISTRIBUTION MADE PRACTICAL AND COMMERCIALLY SUCCESSFUL.

## POINTS OF SUPERIORITY:

Our system is much more simple and consequently more durable than any other, either direct or alternating.

Our generator is much more efficient than any other alternator, requires less attention and absolutely no supplies except lubricant for bearings.

It is practically self-regulating without the loss of energy involved by compounding or compensating. Other multiphase machines require a balance of load.

We have entirely eliminated from our generators the usual sources of trouble, expense and interruption of service: i. e., the revolving armature, commutator, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to the high voltages required for power transmission work; in latter case doing away with the expense and loss of step-up transformers; the usual central station machine can be connected at will for either 1,000 or 2,000 volts.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in uniformity of speed under different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

**Patents**—Our apparatus is novel, different from anything heretofore made, and covered by patents that fully protect us and our customers. We are not infringing patents belonging to others, and shall avail ourselves of the patents under which we operate to protect ourselves from piracy by other manufacturers.

MANUFACTURERS OF THE

# STANDARD LOUD SPEAKING TELEPHONE.

**Employing Milde Microphone.**
U. S. Patent granted April 17, 1894.

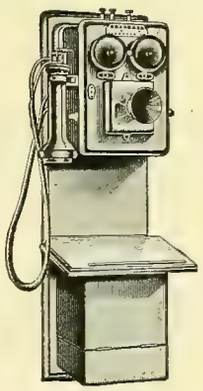
Perfect in Detail, of Highest Efficiency, and Best Possible Electrical and Mechanical Construction.

Sole Agents for the United States for the celebrated

**Milde Battery Transmitter.**

Sensitive as a Blake.
Powerful as a Solid-back.
No adjustment required.
Will not Pack or get out of order.

**For Simplicity, small dimensions, entire multicontact, and powerful transmission it has no equal. Adopted by Governments, Exchanges and Railways in EUROPE, ASIA and SOUTH AMERICA.**



**Standard Telephones**
Have been adopted by Telephone Exchanges, Leading Railway Companies and Corporations, throughout the United States, for long distance work after severe comparative tests.

**Our Warehouse Telephone System**
Is in use in Public Buildings Banks, Wholesale Houses and Factories.

**Contractors for Complete Telephone Exchanges**
For Cities, Towns or Villages, Toll Lines and Warehouse Plants.

LONG AND SHORT DISTANCE. (Non-Infringing.)

**The Milde Transmitter** has received the following awards:—Gold Medals at Havre, Barcelona, and Brussels, 1887-88; eight Gold and Bronze Medals, Paris, 1889; Gold Medal, Edinburgh, 1890; Hors Concours, Paris, 1890, Chicago, 1893, and numerous others. **COMPARISON INVITED.**

***Trial Instruments sent to any part of the United States.***
***Many leading Supply houses handle our apparatus exclusively.***
***Prices moderate. Liberal discount to dealers ordering in quantities***

**Correspondence Solicited.**

We Sell on Merit, and will Guarantee Perfect Satisfaction.

# The M. & B. Telephone Co.

Own letters patent No. 361,124, issued April 12, 1887, which covers all possible forms of Battery Transmitters in which the Electrodes are *not* in *constant contact*, and they are not affected in any way by the Berliner Transmitter Patent. Send in your orders.

## INVENTIONS, RESEARCHES and WRITINGS of NIKOLA TESLA.

BY THOMAS COMMERFORD MARTIN.

**Cloth. 8vo. 330 Cuts and New Portrait. 500 Pages. Price $4.00.**

Some idea of the scope of this remarkable record of new work in electrical invention and research may be formed from the following table of

**CONTENTS.**

**PART I.—Polyphase Currents.**

CHAPTER 1. ..Biographical and Introductory.
CHAPTER 2....A New System of Alternating Current Motors and Transformers.
CHAPTER 3 ...The Tesla Rotating Magnetic Field.—Motors with Closed Conductors.—Synchronizing Motors.—Rotating Field Transformers.
CHAPTER 4....Modifications and Expansions of the Tesla Polyphase Systems.
CHAPTER 5....Utilizing Familiar Type of Generators of the Continuous Current type.
CHAPTER 6....Method of Obtaining Desired Speed of Motor or Generator.
CHAPTER 7....Regulator for Rotary Current Motors.
CHAPTER 8....Single Circuit, Self-Starting Synchronizing Motors.
CHAPTER 9....Change from Double Current to Single Current Motor.
CHAPTER 10....Motor with "Current Lag" Artificially Secured.
CHAPTER 11 ...Another Method of Transformation from a Torque to a Synchronizing Motor.
CHAPTER 12....."Magnetic Lag" Motor.
CHAPTER 13 ...Method of Obtaining Difference of Phase by Magnetic Shielding.
CHAPTER 14....Type of Tesla Single-Phase Motor.
CHAPTER 15....Motors with Circuits of Different Resistance.
CHAPTER 16....Motor with Equal Magnetic Energies in Field and Armature.
CHAPTER 17....Motors with Coinciding Maxima of Magnetic Effect in Armature and Field.
CHAPTER 18....Motor Based on the Difference of Phase in the Magnetization of the Inner and Outer Parts of an Iron Core.
CHAPTER 19....Another Type of Tesla Induction Motor.
CHAPTER 20 ...Combinations of Synchronizing Motor and Torque Motor.
CHAPTER 21....Motor with a Condenser in the Armature Circuit.
CHAPTER 22....Motor with Condenser in one of the Field Circuits.
CHAPTER 23....Tesla Polyphase Transformer.
CHAPTER 24....A Constant Current Transformer with Magnetic Shield between Coils of Primary and Secondary.

**PART II.—The Tesla Effects with High Frequency and High Potential Currents.**

CHAPTER 25....Introductory: The Scope of the Tesla Lectures.
CHAPTER 26....The New York Lecture. Experiments with Alternate Currents of very High Frequency, and their application to Methods of Artificial Illumination. May 20, 1891.
CHAPTER 27....The London Lecture. Experiments with Alternate Currents of High Potential and High Frequency. February 3, 1892.
CHAPTER 28....The Philadelphia and St. Louis Lecture On Light and other High Frequency Phenomena. February and March, 1893.
CHAPTER 29....Tesla Alternating Current Generators for High Frequency.
CHAPTER 30....Alternate Current Electrostatic Induction Apparatus.
CHAPTER 31...."Massage" with Currents of High Frequency.
CHAPTER 32....Electric Discharge in Vacuum Tubes.

**PART III.—Miscellaneous Inventions and Writings.**

CHAPTER 33....Method of Obtaining Direct from Alternating Currents.
CHAPTER 34....Condensers with Plates in Oil.
CHAPTER 35....Electrolytic Registering Meter.
CHAPTER 36....Thermo-Magnetic Motors and Pyro-Magnetic Generators.
CHAPTER 37....Anti-Sparking Dynamo Brush and Commutator.
CHAPTER 38... Auxiliary Brush Regulation of Direct Current Dynamos.
CHAPTER 39....Improvement in Dynamo and Motor Construction.
CHAPTER 40....Tesla Direct Current Arc Lighting System.
CHAPTER 41....Improvement in Unipolar Generators.

**PART IV.—Appendix: Early Phase Motors and the Tesla Oscillator.**

CHAPTER 42....Mr. Tesla's Personal Exhibit at the World's Fair.
CHAPTER 43....The Tesla Mechanical and Electrical Oscillators.

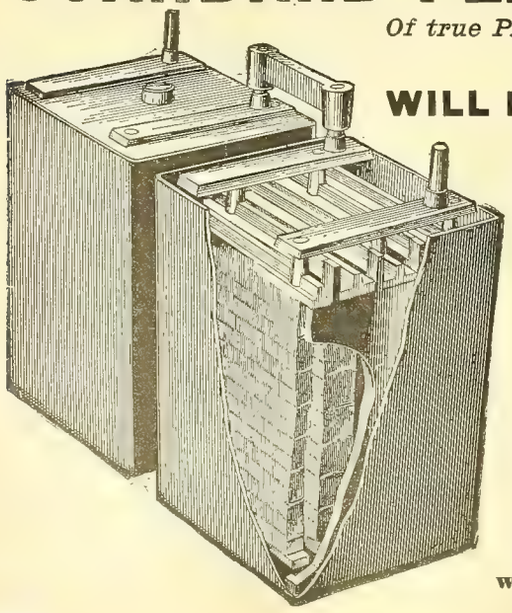
# STANDARD PLANTE STORAGE BATTERIES



*Of true PLANTE Type and CRYSTALLINE FORMATION.*

Will give or receive without injury, currents that would destroy other batteries.

**WILL NOT SULPHATE, DISINTEGRATE OR BUCKLE.**

Contain no asbestos or other separating material to increase their internal resistance.

**ESPECIALLY ADAPTED TO CENTRAL STATION AND POWER-HOUSE SERVICE.**

Absolutely free circulation of electrolyte preventing discharge of one plate into another.

**Highest efficiency, largest delivery, lowest internal resistance.**

For efficiency, reliability, durability, and capacity to receive and yield excessive currents, they are unequaled by any other battery on the market in this country.

**Cannot be damaged by excessive charge or discharge currents.**

A 400 ampere current has been taken from a 120 ampere hour cell.

**CHALLENGE:** We will place an equal number of these cells in series-circuit with any other cells of like capacity, and submit them to charge and discharge currents as high as the circuit can give and receive; and we guarantee no distortion or deterioration of plate in our cells under currents that no other cell will withstand.

# Dictionary of Electrical Words, Terms and Phrases.
**By EDWIN J. HOUSTON, A. M.**
**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

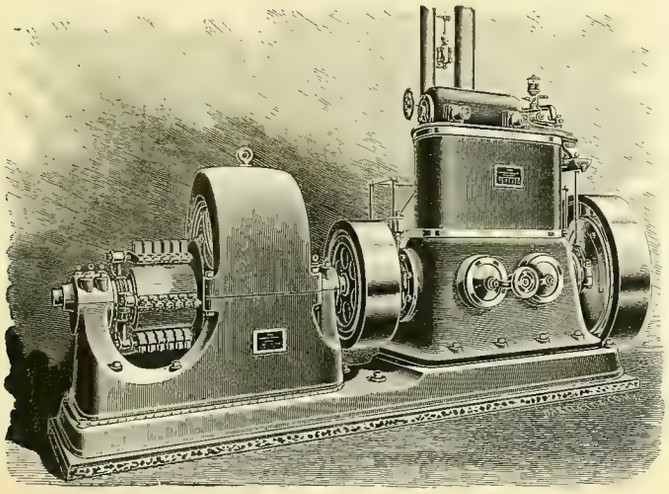
3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

SEND IN YOUR ORDER NOW.

**ELECTRICIAN PUBLISHING CO., 6 Lakeside Building, Chicago, Illinois.**



# A BUSINESS PROPOSITION:

*Any purchaser, so desiring, is welcome to have his engine tested by his own expert at our shops before shipment, and may accept or reject the engine on that test before incurring the expense of installation.*

## THE WESTINGHOUSE ENGINE.
### THREE TYPES:

**COMPOUND, 5 to 1,000 H. P.,** Unequaled simplicity, high efficiency and moderate cost.
**STANDARD, 5 to 250 H. P.,** A high-class automatic, endorsed by thousands of users.
**JUNIOR, 5 to 75 H. P.,** A durable and efficient automatic engine at a low price.

**CATALOGUE ON APPLICATION.**

## THE WESTINGHOUSE MACHINE COMPANY,
**PITTSBURG, PA., U. S. A.**

SELLING OFFICES:

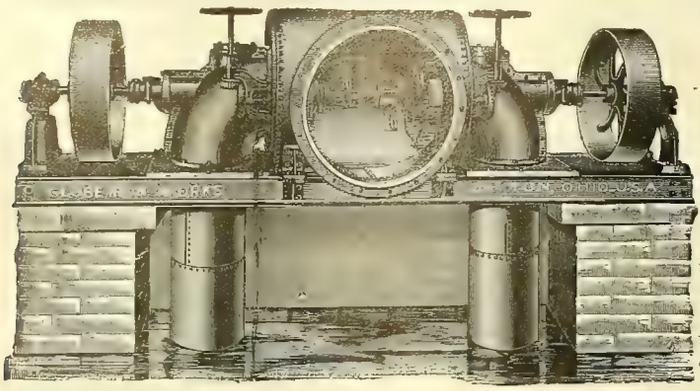
Wonderly Bldg., Grand Rapids, Mich.
All Offices of the Westinghouse Electric & Mfg. Co. And All Foreign Countries.



# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |

# IMPORTANT TO OWNERS OF ELECTRIC RAILWAYS.

ELECTRIC POWER cannot be produced cheaply when the demand is variable. Most Railroads have exceedingly variable loads. By the use of CHLORIDE ACCUMULATORS variable loads are converted into constant loads, and FOR THIS WORK THE FIRST COST AND DEPRECIATION OF STORAGE BATTERIES IS LESS THAN THAT OF BOILERS, ENGINES AND DYNAMOS, while the system is more EFFICIENT and the service more RELIABLE.

For full information write to

## THE ELECTRIC STORAGE BATTERY COMPANY,

DREXEL BUILDING, PHILADELPHIA.

# A NEW BOOK!

## NOW READY.

# New Dynamo Tenders' Hand-Book.

226 Pages. 138 Engravings. Hand-Book Size.

Lieut. F. B. Badt's latest addition to our famous hand-book series, of which 30,000 copies have been sold. The new book contains more than twice as many pages and twice as many engravings as were comprised in the old, and will continue to retain the distinction of being the ONLY STANDARD WORK for the practical dynamo man and the learner.

**NOW READY.** **PRICE, $1.00.**

MANUFACTURERS OF THE

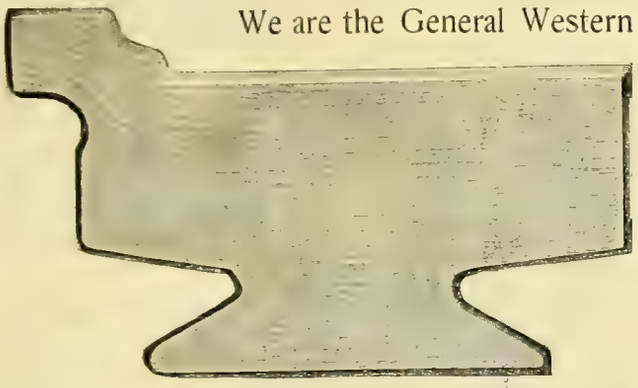
# "ROYAL ALTERNATOR."

No Commutator! No Moving Wire! Efficiency High! Regulation Close! Fully Guaranteed!

TRANSFORMERS OF ANY DESCRIPTION. DIRECT CURRENT GENERATORS AND MOTORS.

AGENCIES { EASTERN:—H. B. COHO & CO., 203 Broadway, New York.
CENTRAL WESTERN:—E. B. HILLMAN & CO., Peoria, Ill.
SOUTHWESTERN:—GINOCCHIO ELECTRIC CO., Dallas, Texas.

# Electric Railway Supplies.



We are the General Western Agents for the Billings & Spencer Drop-Forged

## Trolley Equipments and Commutator Segments.

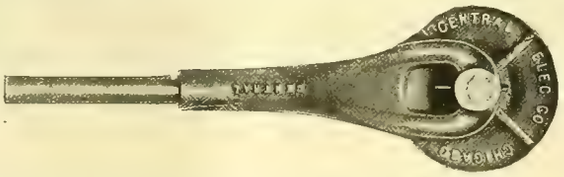
We can supply Segments from stock to fit all standard machines. These Segments are made from pure lake copper, finished and tempered to give a compact, uniform wearing surface.

## Overhead Material.

We carry a large stock of Drop-Forged Straight-Line Hangers, Single and Double Curve Pull-Offs, Bracket-Arm Insulators, Barn and Bridge Hangers, Feed Wire Hangers, Trolley Wire Clamps, etc.

## Central Trolley Harp and Wheel.

This harp is made of malleable iron or brass, and is strong and well designed. The wheels are of bronze and have the best grade of graphite bushings. The entire construction is such that it cannot engage with, and tear down, span wires. We recommend the Central Harp and Wheel to our customers as being a superior article in every way.



Prompt shipment of all goods from Chicago stock.

### This Was A Good One.

"Did I tell you the latest bright thing my little boy got off?" asked McBride, as he joined a group of friends at the club.

"Yes, you did," replied all, in concert with discouraging unanimity.

"That's where I've caught you," retorted McBride, "for it only happened last evening, and I haven't seen a soul of you fellows since. Besides this was really a good one."

"Then you haven't told it to us," replied Kilduff, speaking for the crowd. "Go on."

"Yes, tell us quickly," added Skidmore, "and let us have the agony over."

Thus encouraged, McBride began: "You know, boys, little people have sharp ears, and they are not at all backward about telling any little scraps of information they pick up. This peculiarity has led a good many parents to resort to spelling words when their young children are present. Of course that sort of thing is of no avail after the youngsters learn to spell. Well, Mrs. McBride and I are in the spelling stage now, and little Freddy is often very much mystified by our remarks to each other. Last night we had our new minister to dinner, and Freddy watched the good man helping himself very liberally to biscuits. He thought it a good opportunity to put into use the family verbal cipher, feeling perfectly certain that the minister would find it unintelligible. So he called out, 'Mamma!'

"'What is it, Freddy?' asked my wife.

"'Mamma, isn't the m-i-n-i-s-t-e-r a p-i-g?' spelled out Freddy, triumphantly."

The fellows had to admit that this story about McBride's boy was really a good one.

William Henry Siviter.

Workingmen not only have the sensitiveness of other people about their personal integrity, but sometimes may have a neat way of replying to an imputation upon it.

A carpenter, sent to make some repairs in a private house, entered the apartment of the lady of the house with his apprentice.

"Mary," the lady called to her servant, "see that my jewel case is locked at once!"

The carpenter understood. He removed his watch and chain from his vest with a significant air, and gave them to his apprentice.

"John," he said, "take these right back to the shop. It seems that the house isn't safe!"—Youth's Companion.

The following story is told on Lee Fairchild. At the time the incident occurred Fairchild was holding an editorial position on The West Shore, and was known as the "humorous editor." While writing in the business office one day a stranger entered and inquired if the proprietor was in.

"Yes, sir," replied Fairchild.

"Are you the gentleman?" continued the stranger.

"Yes, sir, but the proprietor is in the other room," answered Fairchild.

When Mr. Samuels, the proprietor, learned of the distinction the young man had drawn between himself and his employer, he discharged him, with the statement.:

"You vos too funny."—San Francisco Post.

### Not The Same.

A neat example of the retort admonitive was recently made by a young Colorado mining engineer, whom we will call Morton, principally because that is not at all like his name. Seated in a chair in a Denver barber shop, undergoing a shave at the hands of a favorite barber, who, although an excellent craftsman, sometimes committed the mistake of becoming too familiar in conversation, the talk turned on the case of a man who, being on trial for murder, had been recognized by visitors to the court room as a young theological student from a Middle state, where he had been the possessor of a spotless reputation and a totally different name. The conversation thereupon drifted to the subject of changed identities.

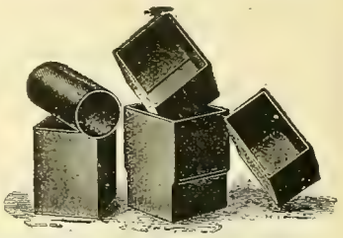
Morton's barber rubbed the razor on the strop reflectively, and said: "Yes, it's surprising how many men change their names after they get out West. By-the-way, Morton, what was your name back East?"

"Mister Morton," was the quiet reply.—Harper's Monthly.

Johnny: Papa, what do people mean when they talk about your constituents?

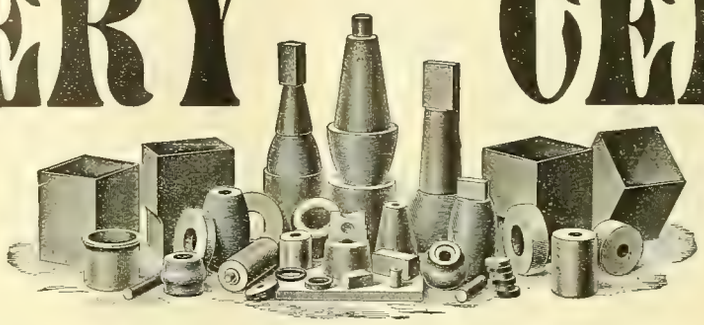
Mr. Jenkins, M. C.: A constituent, Johnny, is a man who expects you to get him a job.—Judge.

# THE FREEMAN



# BATTERY CELLS.

Estimates Furnished on Application. Prompt Delivery.



Standard Sizes Always on Hand.

The composition used in the manufacture of these battery cells makes them positively acid-proof, which result has never before been accomplished providing additional strength to such an extent that this cell can be used where no other would be practical.

## RESULT OF A CENTRAL STATION TEST OF

# Edison and Columbia Lamps.

After numerous comparative **tests made by a large Central Station** in this country of **new type Edison** and **Columbia Lamps,** the result attained shows that after **500** hours' burning the **"New Type" Edison Lamp gave but 7** candle power and the **Columbia at 600 hours gave 13½ candle power.**

It is evident that as far as illumination is concerned the **new type Edison Lamps died in their infancy.**

The filament may have remained unbroken; therefore, the user **would not** be permitted to return bulb and receive the customary rebate.

As a result of tests made, **an order was placed for 20,000 Columbia Lamps and a previous order of like number of Edison lamps cancelled.**

The net price for each Columbia lamp was five cents higher (or $1,000 on total order) than the price of the Edison lamp. We have not engaged in the moonshine business, therefore cannot offer you "Crescent" lamps.

## WE MAKE ONLY THE HIGHEST GRADE. QUALITY SPEAKS FOR ITSELF.

**Make your own tests of Edison "New Type" and Columbia lamps. Then you will know whether Edison lamps are worth 15 cents and Columbia 45 cents. Our selling price, at present, in barrel lots is 20 cents each.**

**LAMPS IN STOCK AT BRANCH OFFICES.**

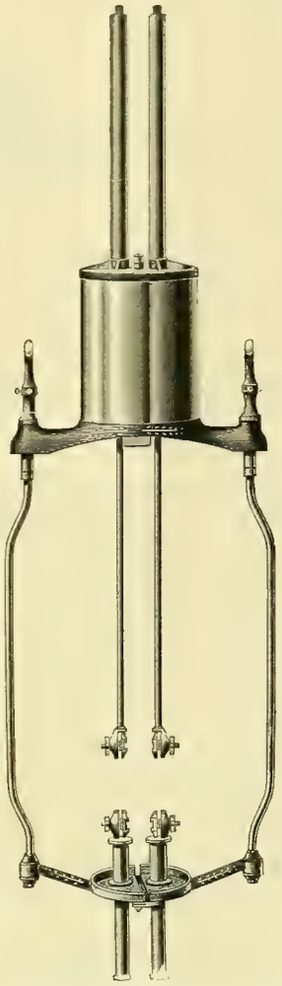
# WESTERN ELECTRIC CO.,

CHICAGO. NEW YORK.



# DOUBLE CARBON LAMPS.

## Important Patent Decision.

From the year 1885 to late in 1890, the Western Electric Company sold double carbon lamps made under a patent of Mr. C. E. Scribner (No. 418,758 of January 7, 1890.)

A feature of this lamp was the simultaneous lifting of both the upper carbons when the current was turned on, after which first one carbon was fed down and consumed and then the other. As a double carbon lamp the Scribner lamp was much liked by many users. In fact, it is considered by many to be by far the best double carbon lamp ever produced. It is still in extensive use.

The Brush Electric Company of Cleveland set up the claim that this lamp was an infringement of a patent of theirs, and a suit was brought in Toledo against a user of the lamps in 1887, which suit was decided at Toledo in 1890 adversely to the user. The lamps which were involved in this suit were at once changed to a non-infringing type satisfactory to the judge who heard the Toledo case, and we discontinued the manufacture and sale of the earlier form of double lamp.

The suit at Toledo having been against a customer of ours, and not against ourselves (although we conducted the defense of that suit), the decision at Toledo was followed by a suit in Chicago against the Western Electric Company. A considerable amount of testimony, additional to that introduced at Toledo, was put into the Chicago case by us.

In the meantime we placed upon the market two new forms of double lamps in which the lamps themselves were double, as distinguished from double ***carbon*** lamps. In a double ***carbon*** lamp like the Brush Company's lamp and our first Scribner lamp, there is one lamp mechanism controlling two pairs of carbons. These two new types of double lamps were named the Monitor lamp and the Duplex lamp. Each consisted of two complete single lamps in one case or frame, one burning its carbons after the other.

Even these were claimed by the Brush Company to be infringements, and a separate suit was brought at Chicago to determine the question. But inasmuch as this was a new question of infringement, no injunction was granted pending a final hearing, and we have continued to supply those double lamps.

The two suits mentioned above as having been brought in Chicago against the Western Electric Company came to a final hearing last Spring, and a decision has just been filed by Judge Showalter dismissing both bills and holding that the patent sued on is limited to a construction where upon turning on the current one of the carbons is lifted after the other, or where the lifting is, in the language of the patent itself, "dissimultaneous." The injunction which has been in force pending a final hearing of the case on our double carbon lamp is of course terminated. Any of our older customers who have lamps of that pattern, and who desire more of them, can now have their orders filled.

Double carbon lamps for low tension or for high tension circuits will be made according to the earlier and favorite plan in which the current lifts both upper carbons at once and then feeds one down so as to consume it before the other burns at all.

Before putting our first double carbon lamp upon the market we made a careful study of the existing patents and did not think that any question of infringement could be raised against it.

It is gratifying to us after a long course of litigation to have our position so fully sustained as it is in the lucid and common-sense opinion filed on the 24th of July by Judge Showalter. The double carbon lamp patent of the Brush Company will expire September 2, 1896.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.
Colored Glass Insulators to designate different currents.

## LOCATIONS FOR INDUSTRIES.

The name of the Chicago Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The Company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns and operates 6,168 miles of Railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota, and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of a territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this Company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway, makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address,

**LUIS JACKSON,**
Industrial Commissioner, C. M. & St. P. R'y,

## Continuous Current Dynamos and Motors:

**THEIR THEORY, DESIGN, AND TESTING.**

**With Sections on Indicator Diagrams, Properties of Saturated Steam, Belting Calculations, Etc.**

**AN ELEMENTARY TREATISE FOR STUDENTS.**

By FRANK P. COX, B.S.

**Cloth. 271 Pages, 83 Illustrations. Price $2.00.**

Intended for students, this work gives the theory and design of continuous current dynamos and motors as understood and practiced in the designing-room, and the methods of testing described are those of the factory testing-shop. The practical side of the various questions treated is always kept in view, discussions having little bearing in this direction being excluded, and the higher branches of mathematics avoided. The application to the design of armatures, field-magnets and motors of the principles developed is explained by reference to numerical problems, thus thoroughly impressing them on the student's mind. Methods of testing a complete machine and of investigating its characteristics are given, with discussions on the effect of various changes in design and operation. The steam-engine being so closely allied to the testing and operation of dynamos and motors, sections on indicator diagrams, steampower calculations, and belting are included. Almost all of the numerous curves in the book are derived from actual commercial tests.

CONTENTS.

Chapter I. The Absolute System of Measurement.—Chapter II. Electro-Magnetic Induction.—Chapter III. Classification of Machines and General Principles of the Magnetic Circuit.—Chapter IV. The Dynamo as a Motor.—Chapter V. Calculations Pertaining to the Magnetic Circuit.—Chapter VI. Theory of Windings, Losses, etc —Chapter VII. The Dynamo Considered as a Motor.—Chapter VIII. Design of Armatures.—Chapter IX. Design of field-magnets.—Chapter X. Design of Motors.—Chapter XI. Dynamo and Motor Testing.—Chapter XII. **WE BELIEVE** in producing Apparatus which is Strictly Non-Infringing, and frown on patent pirate concerns.

## THE NEW LONG-DISTANCE

# MICROPHONE (BATTERY) TELEPHONE

OF THE

## Western Telephone Construction Co.

Is as much superior to any other type of Microphone (Battery) Telephone as our No. 1 Magneto Telephone was to all other magneto 'phones.

The New Exchanges at Newark, O., Johnstown, Pa., Oskaloosa, Ia., and Winona, Minn., each using 300 of these instruments, we claim to be

### The most Perfect Exchanges of their size in the United States, without Exception.

The Superiority of Service and Economy of Operation afforded by them have practically resulted in transfering the business from the Bell system to the Western in these cities, notwithstanding the Bell offer of one-half rates.

### ARMOUR & CO., UNION STOCK YARDS, CHICAGO,

Have just been equipped with a 50-telephone Exchange System of our new apparatus, to take the place of a Kokomo outfit formerly in use there.

We also displaced a Kokomo switchboard outfit for 100 'phones at the

### CAMBRIA IRON WORKS, JOHNSTOWN, PA.,

At about double the price paid for the former, which proved to be unsatisfactory.

### THE INTERIOR DEPARTMENT, WASHINGTON, D. C.,

After the most exhaustive examination, tests and trials for telephones ever made, awarded this Company the contract at almost double the price for apparatus of the next highest bidder. The expert committee which made the examination stated:

> "The Western Telephone Construction Company stood above the others, also it was found that not only were the "Switchboards proposed to be furnished by the Western Telephone Construction Company free, as far as your "committee are at present aware, from infringement of any patent not owned by that company, but that they embody "all recent improvements in that line."

## MANUFACTURING EVERYTHING

Necessary for the complete equipment of a Telephone Exchange, we can assure those who contemplate purchasing instruments that they will save time and money by dealing directly with us, as we have ample facilities, and have had abundant experience in all departments of telephone work.

# WESTERN TELEPHONE CONSTRUCTION COMPANY,

## 250-4-6 South Clinton Street, Chicago.

☞ **NOTE.**—Beware of the falsehoods and misrepresentations of competitors who dare not give a public list of their exchanges, but pretend to have "letters, etc.," which they show. Write direct to parties and ascertain the truth!

# THE TELEPHONE HAND-BOOK

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

## 146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and THE TELEPHONE HAND BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that any one can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other Forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bells.
26. Automatic Switches.
27. Telephone Line Construction.
28. Metallic Circuits.
29. Underground Wires.
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser: its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.
Appendix.

**TESTIMONIALS.**

We submit among hundreds of others the following testimonials, and call attention to the fact that they are from expert electricians, managers of exchanges and superintendents of railroad telegraph.

"A whisper is distinctly heard. We pronounce the Standard perfect." STEELE CO. (N. D.) TEL. CO.

"We talked to Rowell, 75 miles, through storm induction. Have discarded the Bell for Standard." PECOS IRRIGATION & IMP. CO., Eddy, New Mexico.

"Have used Cushman, Harrison and Bell, but consider the Standard far superior." C. A. ROOD, Reedsburg, Wis.

"I should recommend Standard to our people, as against any other with which I am familiar. The test we gave was between St. Paul and Dickinson, 559 miles." O. C. GREENE, Supt. Telg. Northern Pacific Ry.

"Your instruments are working very nicely and every one exceedingly pleased with them. You will have all the business you can do." HOME TELEPHONE CO., Sioux City, Iowa.

"The Standard when known will knock out inferior instuments." U. J. FRY, Supt. Tel. C., M. & St. P. Ry.

"Better than any of the others we have." E. PENNINGTON, Supt. Tel. "Soo" Ry.

"Have given Standard extremely hard test where induction is heavy, with most satisfactory results. J. R. MICHAELS, Supt. Tel. St. Paul & Duluth Ry.

"The Standard will transmit a whisper or a shout with equal clearness." HUMPHREY JONES, Washington C. H., Ohio.

"Their efficiency and working is perfect. We shall use nothing but Standard." GALLAGHER BROS. Meridian, Miss.

**CORRESPONDENCE SOLICITED.**

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

Don't let your contracts until you get our prices.
Prompt attention given to all orders.

## Electric Railway Material.

**We invite a comparison** of the **Pharos Lamp** with any other lamp made, item for item. However conscientious the **laboratory** test, it signifies very little to the outsider. It's a poor miller that can't make light bread with his own flour. The station test, the test of everyday running, is the one that proves the pudding. **Send a trial order for 50 or 100 lamps and make your own test.** Prompt shipments.

OKONITE — IT NEVER DISAPPOINTS

NEW ORLEANS: 1010 Canal St.

# The Ohio Storage Battery Company,

Sole Manufacturers, under Exclusive License, of the Ford-Washburn Storelectro Co.'s Storage Batteries: **The most durable Batteries ever produced. For Street Railways, Lighting Plants, Electric Launches, Electric Carriages, Doctors and Dentists; and for any other work where Storage Batteries can be used.**

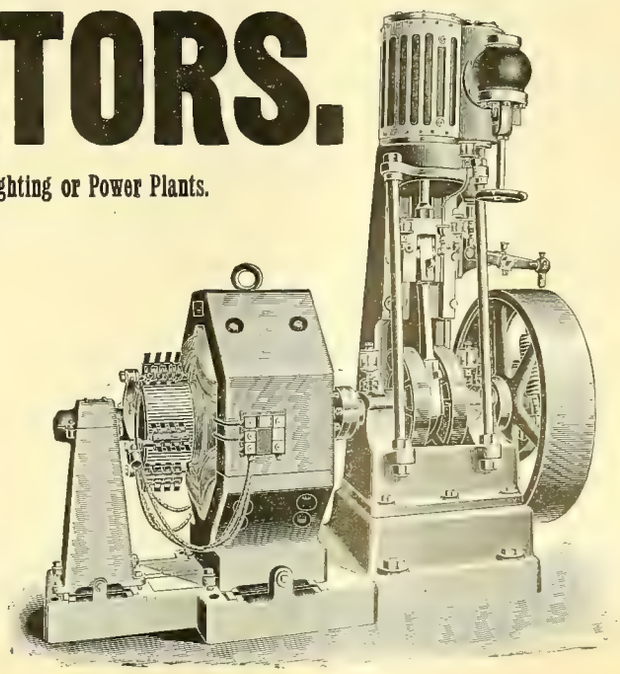
**SPECIALTIES:** Isolated Plants for house lighting, and cells for surgical, telegraph, telephone and phonographic uses. Small cells made to order. Send for catalogue giving capacities, weights, etc.

**MAIN FEATURES OF THE CELL:** **The ability to stand an incessant charge and discharge without any injury, which is an advantage that cannot be exaggerated; the capability of enduring a repeated discharge on a dead short circuit without injury to the cells; the special form of cell which frees IT from the weaknesses that have made other types a failure.**

**EASTERN OFFICE: 203 Broadway, New York City. J. A. MACHADO, Agent.**

**THE OHIO STORAGE BATTERY CO.,** 52 WADE BUILDING, CLEVELAND, OHIO, U. S. A.

# EDDY GENERATORS.



Direct Connected or Belted for Electric Railways, Central Stations, Isolated Lighting or Power Plants.

Of any of the above sizes, either on single plates or with any number of switches upon one plate.

*Cut illustrates 4-way or commutation switch, controls a light or group of lights from any desired number of points.*

SEND FOR CATALOGUE.

**THE HART & HEGEMAN MFG. COMPANY,**
Hartford, Conn.

# The S. K. C. Two Phase Alternating Current System.

THE FIRST AND ONLY COMPLETE AND PERFECTED SYSTEM BY WHICH LIGHT AND POWER CAN BE SUPPLIED FROM THE SAME GENERATOR AND CIRCUITS. POWER TRANSMISSION AND DISTRIBUTION MADE PRACTICAL AND COMMERCIALLY SUCCESSFUL.

## POINTS OF SUPERIORITY:

Our system is much more simple and consequently more durable than any other, either direct or alternating.

Our generator is much more efficient than any other alternator, requires less attention and absolutely no supplies except lubricant for bearings.

It is practically self-regulating without the loss of energy involved by compounding or compensating. Other multi-phase machines require a balance of load.

We have entirely eliminated from our generators the usual sources of trouble, expense and interruption of service: i. e., the revolving armature, commutator, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to the high voltages required for power transmission work; in latter case doing away with the expense and loss of step-up transformers; the usual central station machine can be connected at will for either 1,000 or 2,000 volts.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in uniformity of speed under different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

**Patents**—Our apparatus is novel, different from anything heretofore made, and covered by patents that fully protect us and our customers. We are not infringing patents belonging to others, and shall avail ourselves of the patents under which we operate to protect ourselves from piracy by other manufacturers.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.
Colored Glass Insulators to designate different currents.

**WORK ON SPECIAL DESIGNS A FEATURE.**

THE

# "CLARK" WIRE.

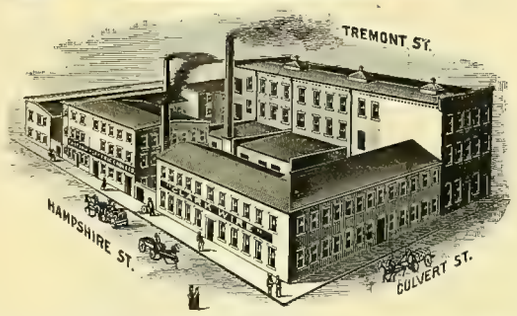
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**BRANCH OFFICE:**

1649, 1650, 1651 MONADNOCK BLDG.,
CHICAGO, ILLINOIS.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

MANUFACTURERS OF

# DIRECT CURRENT SLOW SPEED MULTIPOLAR GENERATORS AND MOTORS.

These machines are constructed with **external armatures.** They have proved remarkably efficient and economical. Used largely in American and European Lighting and Railway Plants. Slow speed machines, made for direct-connection in sizes from 20 H. P. to 2000 H. P.

**Advantages of our External Armature Type.** Maximum peripheral speed of armature with slowest engine speed. Shortest possible winding on armature. Lowest internal resistance of Armature. Only three to four volts difference of potential between commutator bars. Greatest weight of copper per ampere of current. Greatest radiating surface possible. Maximum magnetic effect. Armatures cannot burn out. Great compactness. Correct mechanical design. (The centrifugal force is counteracted effectively by the inward pull of the internal field magnets.) Finest quality of iron, excellent finish, absence of binding wire. **In 8 years' continuous service not one armature has been replaced or repaired.**

**OVER 200,000 H. P. IN USE for Railway, Lighting and Motor Service.** World's Fair Diploma and Medal for **best** direct-connected Generator.

## MODERATE SPEED BIPOLAR GENERATORS AND MOTORS,

With Siemens Drum Armatures, which are copied extensively in this country. We are building these machines in sizes from 1 H. P. to 150 H. P.

## LOCATIONS FOR INDUSTRIES.

The name of the Chicago Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The Company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns and operates 6,168 miles of Railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota, and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of a territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this Company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway, makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address,

**WE BELIEVE** in producing Apparatus which is Strictly Non-Infringing, and frown on patent pirate concerns.

## THE NEW LONG-DISTANCE

# MICROPHONE (BATTERY) TELEPHONE

**OF THE**

# Western Telephone Construction Co.

Is as much superior to any other type of Microphone (Battery) Telephone as our No. 1 Magneto Telephone was to all other magneto 'phones.

The New Exchanges at Newark, O., Johnstown, Pa., Oskaloosa, Ia., and Winona, Minn., each using 300 of these instruments, we claim to be

### The most Perfect Exchanges of their size in the United States, without Exception.

The Superiority of Service and Economy of Operation afforded by them have practically resulted in transfering the business from the Bell system to the Western in these cities, notwithstanding the Bell offer of one-half rates.

### ARMOUR & CO., UNION STOCK YARDS, CHICAGO,

Have just been equipped with a 50-telephone Exchange System of our new apparatus, to take the place of a Kokomo outfit formerly in use there.

We also displaced a Kokomo switchboard outfit for 100 'phones at the

### CAMBRIA IRON WORKS, JOHNSTOWN, PA.,

A about double the price paid for the former, which proved to be unsatisfactory.

### THE INTERIOR DEPARTMENT, WASHINGTON, D. C.,

After the most exhaustive examination, tests and trials for telephones ever made, awarded this Company the contract at almost double the price for apparatus of the next highest bidder. The expert committee which made the examination stated:

> "The Western Telephone Construction Company stood above the others, also it was found that not only were the "Switchboards proposed to be furnished by the Western Telephone Construction Company free, as far as your "committee are at present aware, from infringement of any patent not owned by that company, but that they embody "all recent improvements in that line."

## MANUFACTURING EVERYTHING

Necessary for the complete equipment of a Telephone Exchange, we can assure those who contemplate purchasing instruments that they will save time and money by dealing directly with us, as we have ample facilities, and have had abundant experience in all departments of telephone work.

# WESTERN TELEPHONE CONSTRUCTION COMPANY,

## 250-4-6 South Clinton Street, Chicago.

☞ **NOTE.**—Beware of the falsehoods and misrepresentations of competitors who dare not give a public list of their exchanges, but pretend to have "letters, etc.," which they show. Write direct to parties and ascertain the truth!

# THE TELEPHONE HAND-BOOK

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

## 146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and THE TELEPHONE HAND BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that any one can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other Forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bells.
26. Automatic Switches.
27. Telephone Line Construction.
28. Metallic Circuits.
29. Underground Wires.
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser: its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.

# LONG DISTANCE AND EXCHANGE TELEPHONE,

MADISON, WIS.

**EMPLOYING MILDE MICROPHONE.**

**Milde Battery Transmitter.** No adjustment required. Will not pack or get out of order.

We invite competition with all other instruments, and send Phones for test to any part of the United States.

It is Absolutely Non-Infringing.
We Guarantee Protection to All Customers

**TESTIMONIALS.**

We submit among hundreds of others the following testimonials, and call attention to the fact that they are from expert electricians, managers of exchanges and superintendents of railroad telegraph.

"A whisper is distintly heard. We pronounce the Standard perfect." STEELE CO. (N. D.) TEL. CO.

"We talked to Rowell, 75 miles, through storm induction. Have discarded the Bell for Standard." PECOS IRRIGATION & IMP. CO., Eddy, New Mexico.

"Have used Cushman, Harrison and Bell, but consider the Standard far superior." C. A. ROOD, Reedsburg, Wis.

"I should recommend Standard to our people as against any other with which I am familiar. The test we gave was between St. Paul and Dickinson, 559 miles." O. C. GREENE, Supt. Telg. Northern Pacific Ry.

"Your instruments are working very nicely and every one exceedingly pleased with them. You will have all the business you can do." HOME TELEPHONE CO., Sioux City, Iowa.

"The Standard when known will knock out inferior instuments." U. J. FRY, Supt. Tel. C., M. & St. P. Ry.

"Better than any of the others we have." E. PENNINGTON, Supt. Tel. "Soo" Ry.

"Have given Standard extremely hard test where induction is heavy, with most satisfactory results. J. R. MICHAELS, Supt. Tel. St. Paul & Duluth Ry.

"The Standard will transmit a whisper or a shout with equal clearness." HUMPHREY JONES, Washington C. H., Ohio.

"Their efficiency and working is perfect. We shall use nothing but Standard." GALLAGHER BROS. Meridian, Miss.

Heating by Exhaust Steam,
WITHOUT BACK PRESSURE,
BY THE VACUUM SYSTEM.
ADVANTAGES.
1st.—Can be attached to existing plants at little expense.
2nd.—Effects greatest efficiency from the heating surface by the removal of the water and air, preventing water hammer and stagnant circulation.
3rd.—Saves coal by removal of back pressure from engines; water of condensation, etc.
We are owners of the patent and have equipped the largest plants in the United States; over 500 now in use. Will visit your plant and tell you how much we can benefit you, if you so desire. Send for catalogue P.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

The office of the Electric Launch Company will be at Morris Heights, NEW YORK CITY.

# Dictionary of Electrical Words, Terms and Phrases.

By EDWIN J. HOUSTON, A. M.

562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.

This Dictionary includes 5,000 **distinct Words, Terms and Phrases**. Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition**, giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS**, to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

Central Electric Co., 173 Adams St., Chicago.
Harry M. Shaw, 126 Liberty St., New York

## THOUSANDS!!!

OF ARC LAMPS,

High and Low Tension, Direct and Alternating, for all classes of work.

## CARBONS,

Foreign and Domestic, all of standard makes.
These goods *MUST BE SOLD* to close an estate.
Lowest possible prices. Write to

CHAS. H. WATERMAN, 1305 Havemeyer Building, 26 Cortlandt St., NEW YORK.

## WESTON Electrical Instrument Co.,

114 120 William St., NEWARK, N. J., U. S. A.

### Illuminated Dial Station Instruments.

These instruments are based upon the same general principle and are just as accurate as our regular Standard Portable Direct Current Voltmeters and Ammeters, but are much larger, and the working parts are inclosed in a neatly designed dust-proof cast-iron case which effectively shields the instruments from disturbing influences of external magnetic fields.

Weston Standard Illuminated Dial Potential Indicator, Style E. "Flush Type"

### Weston Standard

Portable Direct Reading Voltmeters and Millivoltmeters. Ammeters and Milammeters, Wattmeters and Voltmeters, for Alternating and Direct Current Circuits.

Our portable instruments are recognized as standards throughout the civilized world.

Our Semi-Portable Laboratory Standard Voltmeters and Ammeters are still better.

They are the most reliable, absolute standards for Laboratory use.

Mention the WESTERN ELECTRICIAN when writing for catalogues.

## When You Have Had

enough fun with your alternating arc lamps, and are tired of their sputter and hum, and want some light—then put up one of our Packard Mogul Lamps. A 200 candle power Mogul will give a better light than any alternating current arc, and costs less to maintain and operate.

NEW YORK & OHIO COMPANY, WARREN, OHIO.

MAKERS OF PACKARD LAMPS.

TRADE MARK. AETNA

## Aetna Railway Insulators, Anderson Line Material,

Manufactured solely by ALBERT & J. M. ANDERSON, 289 to 293 A Street, Boston, Mass.

Correspondence Solicited.

## ALFRED F. MOORE,

MANUFACTURER OF

INSULATED ELECTRIC WIRE,

FLEXIBLE CORDS and CABLES.

200 and 202 North Third Street. - - PHILADELPHIA, PA.

## DRY BATTERIES.

BEST OF ALL IS THE STANDARD,

Made by J. H. BUNNELL & CO., 76 Cortlandt St., New York.

Best Construction and Ingredients. Strongest, most Durable and Reliable. Size 6x2½, 60 cts. per cell.

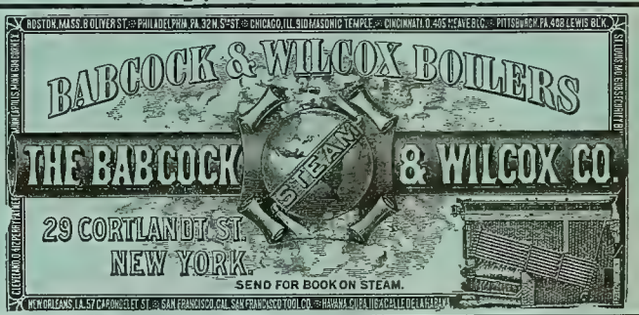
LIBERAL DISCOUNTS.

National India Rubber Co.'s Wires and Cables.

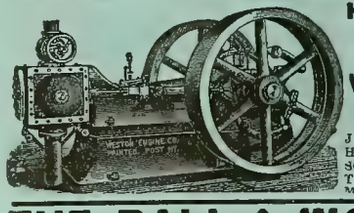
FREDERICK S. MINOTT, General Manager.

BRANCHES:
New York Office, 487 Broadway, H. L. Burdick, Mgr.
San Francisco, 577 and 579 Market St.
Chicago, Metropolitan Electric Co., 186-188 Fifth Ave.

Factory and Offices: BRISTOL, R. I.



## WESTON ENGINES.



High Pressure Boilers.
Complete Power Plants.
Estimates and Drawings Submitted.

WESTON ENGINE CO., PAINTED POST, N. Y.

REPRESENTATIVES.

JULIAN SCHOLL & CO., - 126 Liberty St., N. Y. City.
HOFFMAN-RUSSELL CO., - 82 Lake St., Chicago, Ill.
SCRANTON SUPPLY & MACH'Y CO., - Scranton, Pa.

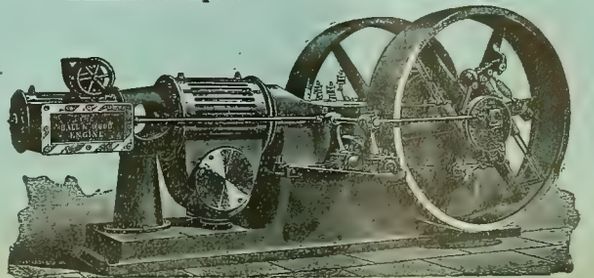
MITCHELL, LEWIS & STAVER CO., Seattle, Wash.

## THE BALL & WOOD COMPANY,

Builders of Improved Automatic Cut-off Engines.



REPRESENTATIVES:

Stern & Silverman, 707 Arch St., Philadelphia, Pa.
George M. Kenyon, Endicott Arcade, St. Paul, Minn.
C. E. Sargent, Fort Dearborn Bldg., Chicago, Ill.
James & Company, Chattanooga, Tenn.

# GENERAL ELECTRIC COMPANY.

**OUR FACTORIES AT**

## SCHENECTADY, N. Y., LYNN, MASS., and HARRISON, N. J.

Are the most extensive electrical factories in the world, and our facilities for manufacturing electrical apparatus for lighting and power purposes of all kinds are unsurpassed. We have made important additions to our equipment, machinery and tools, and are prepared to maintain our recognized reputation for the excellence of the mechanical design and construction of our apparatus combined with the highest efficiency.

**BY OUR**

## THREE PHASE and MONOCYCLIC SYSTEMS

Electric power transmission to near or to distant points is rendered practicable. These are the only commercial economical methods in successful operation. The THREE PHASE SYSTEM is used in numerous plants throughout the country, and is employed to transmit power a distance of twenty-five miles from Folsom to Sacramento in California, and will shortly be in operation to transmit power thirty-five miles to Fresno in the same state. It is also used for driving mills and factories in the East, on account of the decided economy induced by its use. The MONOCYCLIC SYSTEM is finding rapid favor with central station managers; and in St. Louis, one 800 K. W. Monocyclic Generator is in operation and another one of similar size has just been shipped.

We are the PIONEERS of ALL systems of CENTRAL STATION and ISOLATED, INCANDESCENT and ARC LIGHTING throughout the country, and still remain the FOREMOST—a result due to the great inventors associated with us from the start, and the excellent mechanical design and construction of our apparatus.

In ELECTRIC RAILWAY WORK the superiority of our Multipolar Generators, Motors, Series Parallel Controllers and general station apparatus is so recognized by owners and managers of the most successful railways in this country that they are considered the standard to which all other makes are compared.

We were the first company in this country to apply practically the ELECTRIC MOTOR to the operation of the STEAM RAILROAD.

In ELECTRIC MINING WORK we occupy the field alone. Our electric locomotives, drills, hoists, coal cutters, etc., are to be found in mines all over the country, operating successfully and economically.

Our smaller electrical appliances such as Transformers, Recording Watt Meters, Edison Incandescent Lamps, Fan Motors, Stationary Motors, Lightning Arresters, Ammeters, Volt Meters, Porcelain Cut-Outs and Switches, Circuit Breakers, etc., are recognized as the standard throughout the world.

## THIS DRUMMER HAD A CINCH.

**Couldn't Tell Funny Stories, but Knew a Trick Worth Two of That.**

A drummer, as the word drummer is understood in these piping times of peace, is a man who tells you a funny story and incidentally takes your order for goods. A faculty of making himself "solid" with his customers socially is one of the most valuable features of a successful drummer's equipment. The commercial traveler is a hail fellow well met wherever he goes. There are houses whose trade is so firmly established and its hold upon its patrons so strong that its goods sell themselves, almost, and the solicitor has very little soliciting to do. But even with houses of this character a smooth tongue and a ready wit count for much.

Occasionally there is a man who departs from the old lines, invents a method of his own, and makes a great success of it.

"What has become of that man Jones who used to travel for you?" asked one Randolph street jobber of another the other day. "I suppose he has gone off the road. I always thought he never would make a success of it; he was too chilly. He was the chilliest man I ever saw."

"There's just where you're wrong," replied the other jobber, who deals in linseed oil. "He was the most successful traveling man I ever knew. When he was on the road he kept us jumping to fill his orders. The only reason he isn't traveling for us to-day is that another house offered him a good deal bigger salary than we were willing to pay, and he is representing the other house now. He was very chilly, as you say. He was that way with everybody, his customers included. He never had a word to say to them about politics, and couldn't tell a funny story if he tried. He never talked anything but oil. As soon as he got an order he walked out and never tried to conceal the fact that that was all he had come for. Yet his customers thought he was the best friend they had in the world.

"This is how he did it. As a cold-blooded business proposition he decided that the strongest hold he could get on a man would be a hold on his pocketbook. He left the other drummers to do the amusing part of it, but he studied the oil market. He seemed, besides, to have an intuition about the fluctuations of prices which was almost prophetic. When he saw that oil was about to go up he sat down and telegraphed to all his customers, 'Buy oil.' They followed his advice, and in nine cases out of ten they saved a lot of money by it. It only took a few experiences like this to convince them that it was a serious mistake to buy oil of anybody else. He was hardly a solicitor at all. When he told a man to buy he bought."

### Had Been Learning.

"Dear little mother!" said the young man who had been away from home for six months, as he opened a letter addressed to him in the well-known handwriting of his maternal ancestor, "I wish she would go out into the world more and enjoy herself. She is such a domestic little body. I'll get all the news now about the last housecleaning and how the cat and the canary are getting along, and all about having the kitchen painted and buying new rugs for the back parlor, and so forth."

Then he opened the letter and read

"DEAR HARRY: I have just returned from seeing a ball game between our college nine and the team from Miggsville. Our boys were all crippled up. Burnham had a glass arm, Hawkins was almost laid up with a Charley-horse, and Spicer had a game foot. One of the stiffs from Hankinsburg had spiked him three days before. But it would have done you good to see how they fell on that Miggsville pitcher. They pasted him all over the field for six runs in the first inning, all of them earned, and 'Trick' Jackson made one of the longest hits ever seen on the grounds. It was a corking three-bagger, and if Fuddleston had been doing his duty in the coachers' position it would have been a home run. In the fourth inning they knocked the Miggsville twirler out of the box," etc.

## *OUT OF THE GINGER JAR.*

### His Answer.

He rings the bell of the telephone
And, quiet as to make him dizzy,
He gets reply in a monotone—
It is either bzzz or buzz-y!

### Mortuary Statistics Out West

Tenderfoot—"You have a salubrious climate here, I believe?"

Woollywest—"Tol'able, for some folks."

Tenderfoot—"What are the most frequent causes of death according to statistics?"

Woollywest—"W'al, six-shooters, I reckon. Little knifin' and some Winchesters, but they ain't nothin' after all that gits around the six-shooter in a pinch."

### His Way of Putting It.

Conductor in a crowded street car: "Room in the rear of the car for one lady or two gentlemen!"

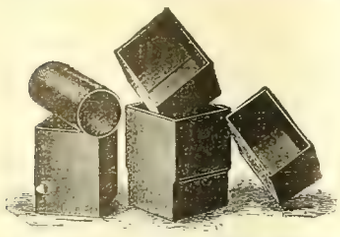
### And Nothing in a Name?

Landlord—"I guess I'll have to raise your rent."

Tenant—"For what."

Landlord—"They've changed the name of this street and it's now an avenue."

—Chicago Record.



# THE FREEMAN BATTERY CELLS.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.

# Notice to Contractors.

## Mt. Sterling, Ohio, Water Works.

Sealed proposals will be received by the Mayor and Council of the incorporated Village of Mt. Sterling, Madison County, Ohio, until 12 o'clock, noon, Tuesday, the 1st day of October, 1895, for furnishing all work and materials necessary for the construction of a system of water works for said village, as follows:

One pumping station.

One duplex steam pump, 500,000 gals. capacity per 24 hours.

One, or more, deep well pumps, 150,000 gals. capacity.

One stand pipe, 16x80 ft.

About 164 tons cast-iron pipe 8 to 4 inches.

28 fire hydrants.

26 valves and valve boxes.

One, or more, drilled wells.

Alternate proposals will also be received for air lift pumping machinery.

Each proposal must be accompanied by cash or certified check of amount equal to 5 per cent. of the amount of the bid, made payable to John W. Hanawalt, Village Clerk, as a guarantee of good faith on the part of the bidders.

All proposals must be made on blanks furnished and shall be sealed and addressed to John W. Hanawalt, Clerk of said Village, and endorsed, Proposal for Water Works.

So far as possible contractors shall employ home labor and purchase material from home dealers in the execution of the work.

Plans and specifications can be seen and blank forms of proposal obtained at the office of said clerk after September 5th, 1895,

Council reserves the right to reject any and all bids.

Printed copy of specifications can be obtained by addressing said clerk.

H. CLAY JOHNSON, Mayor.
JOHN W. HANAWALT, Clerk.

Dated at Mt. Sterling, Ohio, August 29, 1895.

## LOCATIONS FOR INDUSTRIES.

The name of the Chicago Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines.

The Company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns and operates 6,168 miles of Railway, exclusive of second track, connecting track or sidings. The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota, and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of a territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this Company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway, makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address,

**WE BELIEVE** in producing Apparatus which is Strictly Non-Infringing, and frown on patent pirate concerns.

## THE NEW LONG-DISTANCE MICROPHONE (BATTERY) TELEPHONE

**OF THE**

## Western Telephone Construction Co.

Is as much superior to any other type of Microphone (Battery) Telephone as our No. 1 Magneto Telephone was to all other magneto 'phones.

The New Exchanges at Newark, O., Johnstown, Pa., Oskaloosa, Ia., and Winona, Minn., each using 300 of these instruments, we claim to be

### The most Perfect Exchanges of their size in the United States, without Exception.

The Superiority of Service and Economy of Operation afforded by them have practically resulted in transfering the business from the Bell system to the Western in these cities, notwithstanding the Bell offer of one-half rates.

### ARMOUR & CO., UNION STOCK YARDS, CHICAGO,

Have just been equipped with a 50-telephone Exchange System of our new apparatus, to take the place of a Kokomo outfit formerly in use there.

We also displaced a Kokomo switchboard outfit for 100 'phones at the

### CAMBRIA IRON WORKS, JOHNSTOWN, PA.,

At about double the price paid for the former, which proved to be unsatisfactory.

### THE INTERIOR DEPARTMENT, WASHINGTON, D. C.,

After the most exhaustive examination, tests and trials for telephones ever made, awarded this Company the contract at almost double the price for apparatus of the next highest bidder. The expert committee which made the examination stated:

> "The Western Telephone Construction Company stood above the others, also it was found that not only were the "Switchboards proposed to be furnished by the Western Telephone Construction Company free, as far as your "committee are at present aware, from infringement of any patent not owned by that company, but that they embody "all recent improvements in that line."

## MANUFACTURING EVERYTHING

Necessary for the complete equipment of a Telephone Exchange, we can assure those who contemplate purchasing instruments that they will save time and money by dealing directly with us, as we have ample facilities, and have had abundant experience in all departments of telephone work.

# WESTERN TELEPHONE CONSTRUCTION COMPANY,

## 250-4-6 South Clinton Street, Chicago.

☞ **NOTE.**—Beware of the falsehoods and misrepresentations of competitors who dare not give a public list of their exchanges, but pretend to have "letters, etc.," which they show. Write direct to parties and ascertain the truth!

# THE TELEPHONE HAND-BOOK

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

## 146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and THE TELEPHONE HAND BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that any one can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

### CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other Forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bells.
26. Automatic Switches.
27. Telephone Line Construction.
28. Metallic Circuits.
29. Underground Wires.
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser: its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

# The Choice of Transformers.*

**BY PROF. D. C. JACKSON, C. E.**

Member of the American Society of Mechanical Engineers; Member American Institute of Electrical Engineers;
Professor of Electrical Engineering, University of Wisconsin, Madison, Wisconsin.

* * * "In order to place before you independent data representing all the American "transformers of moderate capacities, I will give the results of a long and carefully carried "out series of tests made by A. H. Ford in the laboratory of the University of Wisconsin. "For these tests transformers of fifteen hundred watts capacity, as nearly as possible, were "procured directly from the manufacturers within about a year from this date, so that the "tests may be presumed to represent the latest and best designs which are now supplied. "These transformers are from the most prominent makers, and, in fact, include all impor- "tant makes of American transformers, with two or three exceptions.

"The results of the tests are given in the attached table.

| Number. | Watts Capacity. | Open Circuit Current. | | Watts Iron Loss. | | Watts Copper Loss Full Load. | Total Pressure Drop. | Efficiencies. | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | Full Load. | | All Day. | |
| | | $f$—125 | $f$—60 | $f$—125 | $f$—60 | | | $f$—125 | $f$—60 | $f$—125 | $f$—60 |
| 1 | 1250 | .043 | .066 | 37 | 48 | 30 | 2.5 | 95 | 94 | 85 | 83 |
| 2 | 1500 | .076 | .124 | 50 | 71 | 45 | 3.5 | 95 | 94 | 85 | 81 |
| 3 | 1500 | .052 | .100 | 32 | 46 | 38 | 4.0 | 96 | 95 | 89 | 85 |
| 4 | 2500 | .230 | .540 | 135 | 230 | 44 | 2.5 | 92 | 89 | 77 | 68 |
| 5 | 1800 | .076 | .600 | 53 | 109 | 67 | 5.0 | 94 | 92 | 85 | 75 |
| 6 | 2000 | .055 | .091 | 42 | 56 | 55 | 5.0 | 95 | 94 | 89 | 86 |
| 7 | 1000 | .028 | .064 | 24 | 28 | 53 | 3.0 | 95 | 94 | 87 | 86 |
| 8 | 1500 | .073 | .113 | 57 | 76 | 31 | 2.5 | 94 | 93 | 83 | 79 |
| 9 | 1500 | .077 | .144 | 43 | 55 | 28 | 3.0 | 95 | 95 | 86 | 84 |

**"These results, I find, do not differ very widely from those published by the Fort Wayne "Electric Corporation in a small blue-printed pamphlet, which, however, contains tests made "by the company upon only a few of the makes of transformers included in my table."**

**The transformer marked No. 1 in the above table, is a twenty-five light transformer of the Fort Wayne Electric Corporation's make.**

*Abstract from a paper read before the Northwestern Electrical Association at the summer meeting, held in Chicago, July 17, 18 and 19.

# GENERAL ELECTRIC COMPANY.

Our factories at SCHENECTADY, N. Y., LYNN, MASS., and HARRISON, N. J., are the most extensive electrical factories in the World, and our facilities for manufacturing electrical apparatus for lighting and power purposes of all kinds are unsurpassed. We have made important additions to our equipment, machinery and tools, and are prepared to maintain our recognized reputation for the excellence of the mechanical design and construction of our apparatus combined with the highest efficiency.

By our THREE PHASE and MONOCYCLIC SYSTEMS electric power transmission to near or to distant points is rendered practicable. These are the only commercial economical methods in successful operation. The Three Phase System is used in numerous plants throughout the country, and is employed to transmit power a distance of twenty-five miles from Folsom to Sacramento in California, and will shortly be in operation to transmit power thirty-five miles to Fresno in the same state. It is also used for driving mills and factories in the East, on account of the decided economy induced by its use. The Monocyclic System is finding rapid favor with central station managers; and in St. Louis, one 800 K. W. Monocyclic Generator is in operation and another one of similar size has just been shipped.

We are the PIONEERS of ALL systems of CENTRAL STATION and ISOLATED, INCANDESCENT and ARC LIGHTING throughout the country, and still remain the FOREMOST—a result due to the great inventors associated with us from the start, and the excellent mechanical design and construction of our appa atus.

In ELECTRIC RAILWAY WORK the superiority of our Multipolar Generators, Motors, Series Parallel Controllers and general station apparatus is so recognized by owners and managers of the most successful railways in this country that they are considered the standard to which all other makes are compared.

We were the first company in this country to apply practically the ELECTRIC MOTOR to the operation of the STEAM RAILROAD.

In ELECTRIC MINING WORK we occupy the field alone. Our electric locomotives, drills, hoists, coal cutters, etc., are to be found in mines all over the country, operating successfully and economically.

Our smaller electrical appliances, such as Transformers, Recording Watt Meters, Edison Incandescent Lamps, Fan Motors, Stationary Motors, Lightning Arresters, Ammeters, Volt Meters, Porcelain Cut-Outs and Switches, Circuit Breakers, etc., are recognized as the standard throughout the world.

"SHIP" CORED

(Trade Mark.)

# CARBONS FOR ARC LAMPS,

MANUFACTURED BY

## SCHIFF, JORDAN & CO., VIENNA, AUSTRIA.

SEND FOR SAMPLES AND PRICE LIST TO

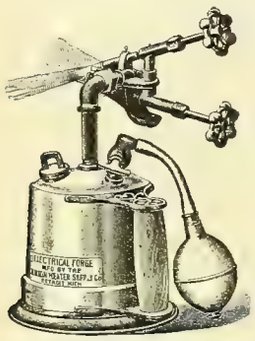
## A. DERONDE & CO., Sole Agents, 254 Front St., NEW YORK.

---

## TO MANUFACTURERS.

Space, light, heat and power **FREE** at ***Matthews, Grant County, Ind.,*** to concerns that employ a limited number of men. Ample railroad facilities, healthy location, good schools, improved streets, electric lights, etc. Address GEO. N. CATTERSON, Treas., 24 Kentucky Ave., Indianapolis, Ind.

---



## ELECTRICAL FORGES

FOR

**ELECTRICIANS, CYCLE MAKERS AND ENGINEERS.**

Nothing better for wire soldering. Where once used it is indispensable.

**The Flames are Strong Enough to Melt Copper.**

**UNION HEATER SUPPLY CO.,**

92 Congress St., East, DETROIT, MICH.

---

## BRAZIER'S "HOT BLAST" BLOW TORCH FOR GASOLINE.

A Powerful Tool. Suitable for

Holds 3 pints of oil; burns about 4 hours with one filling and pumping.

Electricians, Brass Workers and Pattern Makers, Bicycle Manufacturers, Machinists and Tool Makers, Locksmiths and Bell Hangers, Coppersmiths and Boilermakers, Wagon and Carriage Makers and Artisans Generally.

For brazing and tempering small tools and springs, soldering patterns and annealing brass and other metals, heating soldering coppers, glue, burning off paint, general bench furnace work, etc. Packed one dozen in case.

**List Price, $7.50 Each.**

**WHITE MFG. CO.,**

MANUFACTURERS,

40 AND 42 STATE ST., CHICAGO.

---

## PERU ELECTRIC MANUFACTURING COMPANY'S PORCELAIN SPECIALTIES.

ELECTRICAL PORCELAIN to be of any value should be HARD BURNED and THOROUGHLY VITRIFIED, so that it will not absorb moisture.

In our PORCELAIN DEPARTMENT we manufacture for the Electrical trade exclusively, and as we burn by the Natural Gas Process we are enabled to produce ALL KINDS OF ELECTRICAL PORCELAIN of the VERY HIGHEST QUALITY at LOW PRICES.

**PERU ELECTRIC MANUFACTURING COMPANY, PERU, IND.**

---

## ELECTRICAL SUPPLIES,

## ELECTRICAL FIXTURES,

**A FULL LINE IN STOCK.**

## Chicago General Fixture Co.,

**169 ADAMS STREET,**

**CHICAGO, ILL.**

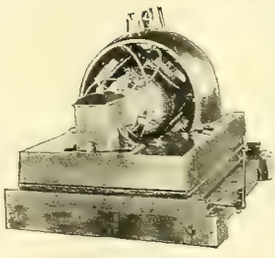
---

## CARD

Generators for Power Transmission or Isolated Lighting.

CARD Generators are all Multipolar and Slow Speed.

**AGENTS WANTED IN UNOCCUPIED TERRITORY.**



75 K. W. GENERATOR.

## CARD

Multipolar Slow Speed Stationary Motors.

Reversible Motors and Controllers for Rolling Mills, Bridges and Traveling Cranes.

**THE CARD ELECTRIC COMPANY,**

Office and Works, Mansfield, Ohio.

---

**THE PIONEER FIRM.**
American Branch Office, 60 Liberty St., New York.

## F. HARDTMUTH & CO., VIENNA, AUSTRIA,

THE ONLY MANUFACTURERS OF

**THE PIONEER FIRM.**
Beware of Impostors Claiming our Make.

# "The Celebrated Austrian Cored Carbons."

Send for Reduced Price Lists or Samples.
Alternating or Direct Cored Carbons One Price.

Special Quotations for Export Trade.
Leading Supply Houses Carry our Goods.

# The Herald of a New Era:

"Interior Conduit had to fight its way, to overcome criticism and opposition; but to-day it has the endorsement of the underwriting bodies of America, and is being rapidly introduced all over Europe."—*Electrical Engineer.*

**In addition** to plain, brass and iron armored conduit for use in buildings, there has been added **Iron Armored Underground** Conduit. This is made in lengths most convenient to handle, and when laid gives a continuous, telescopic insulating tube, without sleeves or joints, and **iron armored** its entire length. As it is air and moisture proof, conductors with light insulation, or *no* insulation can be used—watertight hand- and man-holes made to suit requirements of each case. Correspondence solicited.

## Central Electric Company,

**173-175 Adams Street, CHICAGO.**

BRANCHES:

ST. LOUIS— Southern Electrical Supply Co.
KANSAS CITY— Gate City Electric Co.
NEW ORLEANS— 1010 Canal Street.
BUFFALO— 112 White Building.

# THE ONLY REFLECTOR PLATE ALTERNATING ARC LAMP.

## The Helios Electric Company claims:

That they have more alternating arc lamps in use than all other makes combined.
They guarantee 80 per cent. more available light than is obtained from any other alternating arc lamp.
They guarantee to give as much light as any direct current lamp using the same number of watts.

# SPENCER'S IMPROVED ALTERNATING ARC LAMP

## Possesses the following advantages:

Minimum choke in the regulating coil.
Practically no energy absorbed in the regulating device.
Durability of all its parts; not liable to get out of order.
Can be used successfully on all periods.
Starts quickly.

# SPENCER'S DIRECT CURRENT CONSTANT POTENTIAL LAMP.

## Guaranteed not to see-saw.

**SEND FOR CATALOGUE AND PRICES.**

# HELIOS ELECTRIC COMPANY,

**1229 Callowhill Street, PHILADELPHIA, PA.**

**AGENTS:**

CENTRAL ELECTRIC CO., Western Agents, Chicago, Ill.

# SCHEEFFER'S RECORDING WATT-METER

FOR ALTERNATING CIRCUITS.

No Commutator. No Brushes. No Contact Points.

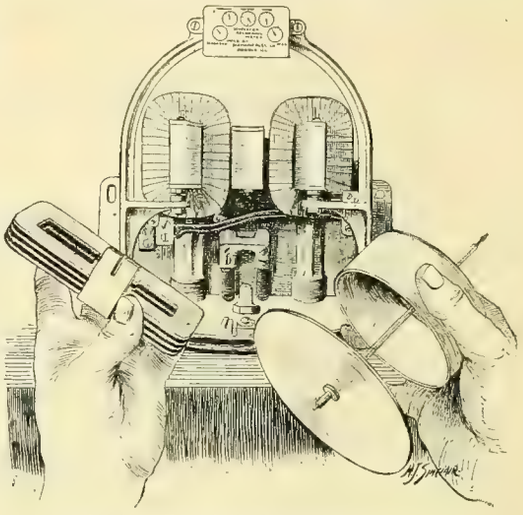
Registers the Actual Power Consumed.

ABSOLUTELY HAS NO RIVAL FOR...
...ACCURACY, SIMPLICITY, DURABILITY.

OVER 5,000 IN USE.

## DIAMOND ELECTRIC COMPANY,

1315 Old Colony Building,
CHICAGO, ILL.



See How Easy It Is To Adjust.

# The S. K. C. Two Phase Alternating Current System.

THE FIRST AND ONLY COMPLETE AND PERFECTED SYSTEM BY WHICH LIGHT AND POWER CAN BE SUPPLIED FROM THE SAME GENERATOR AND CIRCUITS. POWER TRANSMISSION AND DISTRIBUTION MADE PRACTICAL AND COMMERCIALLY SUCCESSFUL.

## POINTS OF SUPERIORITY:

Our system is much more simple and consequently more durable than any other, either direct or alternating.

Our generator is much more efficient than any other alternator, requires less attention and absolutely no supplies except lubricant for bearings.

It is practically self-regulating without the loss of energy involved by compounding or compensating. Other multi-phase machines require a balance of load.

We have entirely eliminated from our generators the usual sources of trouble, expense and interruption of service: i. e., the revolving armature, commutator, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to the high voltages required for power transmission work; in latter case doing away with the expense and loss of step-up transformers; the usual central station machine can be connected at will for either 1,000 or 2,000 volts.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in uniformity of speed under different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

**Patents**—Our apparatus is novel, different from anything heretofore made, and covered by patents that fully protect us and our customers. We are not infringing patents belonging to others, and shall avail ourselves of the patents under which we operate to protect ourselves from piracy by other manufacturers.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.
Colored Glass Insulators to designate different currents.
WORK ON SPECIAL DESIGNS A FEATURE.

THE

# "CLARK" WIRE.

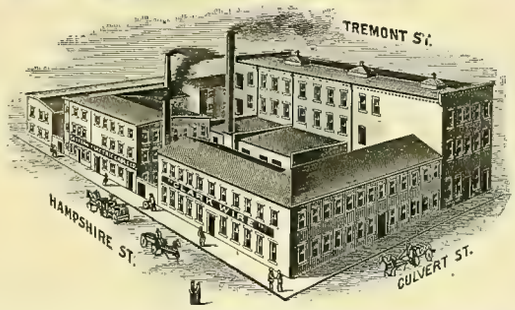
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**BRANCH OFFICE:**

1649, 1650, 1651 MONADNOCK BLDG.,
CHICAGO, ILLINOIS.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

### Mt. Sterling, Ohio, Electric Light Plant.

SEALED proposals will be received by the Mayor and Council of the incorporated Village of Mt. Sterling, Madison county, Ohio, until 12 o'clock, noon, Tuesday, the 1st day of October, 1895, for furnishing all work and materials necessary for the construction of an Electric Light System for said village, as follows:

The machinery to be erected in the pumping station.

BID NO 1—ELECTRIC PLANT.

One Arc Dynamo -30- 2,000 C. P.
One Alternating Current Dynamo -30 to 35 K. W.—and Exciter.
All erected with foundations, belts, etc.
Also switchboard, and station wiring.
Arc Circuit—About 3.5 miles long.
Incandescent Circuit—About 3,000 ft.
Arc Lamps 21 in place, 2 extra.
Converters—Price for various sizes erected.

Proposal for one Alt. Current Dynamo for Arc and Incandescent Lamps and suitable Arc Lamps and accessories will be received.

BID NO. 2—STEAM PLANT.

One 80 H. P. Engine.
Two 5x16 ft. Boilers, with stack.
One 100 H. P. Heater.
One Boiler Pump.
One Injector.
Piping.
All complete with foundations, Boiler setting, and Pipe Covering.

Each proposal must be accompanied by cash, or a certified check for $300 00, made payable to John W. Hanawalt, Village Clerk, as a guarantee of good faith on the part of the bidders.

All proposals must be made on blanks furnished, and shall be sealed and addressed to John W. Hanawalt, clerk of said village, and endorsed, Proposal for Electric Light Plant.

So far as possible contractors shall employ home labor, and purchase material from home dealers, in the execution of the work.

Plans and specifications can be seen and blank forms of proposal obtained at the office of said clerk, after September 5, 1895.

Council reserves the right to reject any and all bids

Printed copy of specifications can be obtained by addressing said clerk.

H. CLAY JOHNSON, Mayor.
JOHN W. HANAWALT, Clerk.

Dated Mt. Sterling, Ohio, August 29, 1895.

Has authorized its agents to sell tickets at greatly reduced rates to Albany, N. Y., on occasion of the meeeting of the German Catholic Societies of the United States in that city, Sept. 15th to 18th. For particulars address

J. Y. CALAHAN, Gen'l Agent,
111 Adams St., Chicago.

# Dictionary of Electrical Words, Terms and Phrases.

**By EDWIN J. HOUSTON, A. M.**

**562 double-column Pages. 570 Illustrations. Cloth Binding. Type Pages 10 x 7 inches. Price, postage Prepaid, to any part of the world, $5.00.**

This Dictionary includes 5,000 **distinct Words, Terms and Phrases.** Each of the great classes or divisions of electrical investigation or utilization comes under careful and exhaustive treatment. For some reasons it deserves rather to be called an **Encyclopædia** than a dictionary.

**The Scheme of Treatment** is as follows:

1st. The words, terms and phrases are invariably followed by a **short, concise definition,** giving the sense in which they are correctly employed.

2d. A general statement then follows of the **Principles of Electrical Science** on which the definition is Founded.

3d. When, from the complexity of the apparatus, or from other considerations, it has been thought desirable to do so, an **Illustration or Diagram** of the apparatus is given.

4th. To facilitate study, an elaborate system of **Cross References** has been adopted, so that it is as **easy to find the definitions** as the words, and aliases are readily detected and traced.

In applying these rules great care has been exercised to secure **CLEARNESS,** to the end that while the definitions and explanations shall be SATISFACTORY TO THE EXPERT ELECTRICIAN, they shall also be SIMPLE AND INTELLIGIBLE to those who have had no training at all in electricity, or are novices in the art.

**HAVING MOVED INTO OUR NEW QUARTERS AT 250-4 SOUTH CLINTON STREET, CHICAGO, WE ARE NOW**

# The Largest Manufacturers of Telephone Apparatus

**AND APPLIANCES, EXCLUSIVELY, IN THE WORLD.**

WE BELIEVE in producing Apparatus which is Strictly Non-Infringing, and frown on patent pirate concerns.

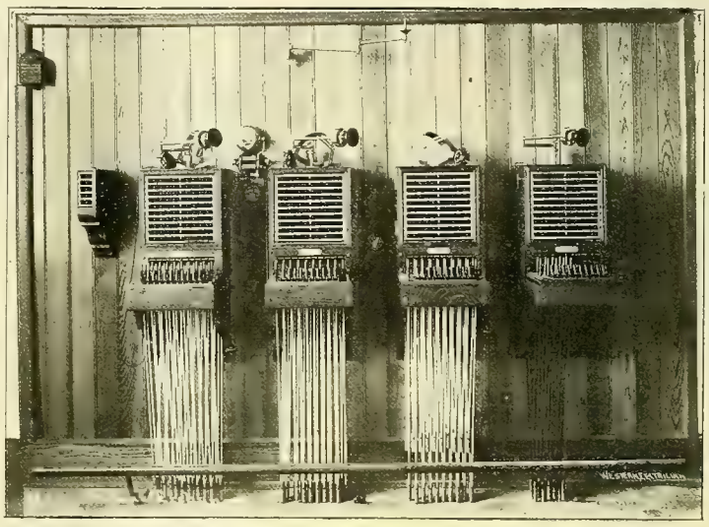
## OUR NEW LONG-DISTANCE MICROPHONE (BATTERY) TELEPHONE

Is as much superior to any other type of Microphone (Battery) Telephone as our No. 1 Magneto Telephone was to all other magneto 'phones.

The New Exchanges at Newark, O., Johnstown, Pa., Oskaloosa, Ia., and Lansing, Mich., each using about 300 of these instruments, we claim to be

### The most Perfect Exchanges of their size in the United States.

The Superiority of Service and Economy of Operation afforded by them have practically resulted in transferring the business from the Bell system to the Western in these cities, notwithstanding the Bell offer of one-half rates.



**Chillicothe, Ohio, "Western" 400 Telephone Exchange.**

### THE INTERIOR DEPARTMENT, WASHINGTON, D. C.,

After the most exhaustive examination, tests and trials for telephones ever made, awarded this Company the contract at almost double the price for apparatus of the next highest bidder. The expert committee which made the examination stated:

> "The Western Telephone Construction Company stood above the others, also it was found that not only were the "Switchboards proposed to be furnished by the Western Telephone Construction Company free, as far as your "committee are at present aware, from infringement of any patent not owned by that company, but that they embody "all recent improvements in that line."

**Nearly 100 are in use in the U. S. Patent Office, displacing Bell system.**

## MANUFACTURING EVERYTHING

Necessary for the complete equipment of a Telephone Exchange, we can assure those who contemplate purchasing instruments that they will save time and money by dealing directly with us, as we have ample facilities, and have had abundant experience in all departments of telephone work.

# WESTERN TELEPHONE CONSTRUCTION COMPANY.

☛ **NOTE.**—Beware of the falsehoods and misrepresentations of competitors who dare not give a public list of their exchanges, but pretend to have "letters, etc.," which they show. Write direct to parties and ascertain the truth!

# THE TELEPHONE HAND-BOOK

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

## 146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and THE TELEPHONE HAND BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that any one can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

### CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver.
10. Other Forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers, Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bells.
26. Automatic Switches.
27. Telephone Line Construction.
28. Metallic Circuits.
29. Underground Wires.
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser: its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.
Appendix.

# LONG DISTANCE AND EXCHANGE TELEPHONE,

MADISON, WIS.

**EMPLOYING MILDE MICROPHONE.**

**Milde Battery Transmitter.** No adjustment required. Will not pack or get out of order.

We invite competition with all other instruments, and send Phones for test to any part of the United States.

It is Absolutely Non-Infringing.
We Guarantee Protection to All Customers

**TESTIMONIALS.**

We submit among hundreds of others the following testimonials, and call attention to the fact that they are from expert electricians, managers of exchanges and superintendents of railroad telegraph.

"A whisper is distintly heard. We pronounce the Standard perfect." STEELE CO. (N. D.) TEL. CO.

"We talked to Rowell, 75 miles, through storm induction. Have discarded the Bell for Standard." PECOS IRRIGATION & IMP. CO., Eddy, New Mexico.

"Have used Cushman, Harrison and Bell, but consider the Standard far superior." C. A. ROOD, Reedsburg, Wis.

"I should recommend Standard to our people, as against any other with which I am familiar. The test we gave was between St. Paul and Dickinson, 559 miles." O. C. GREENE, Supt. Telg. Northern Pacific Ry.

"Your instruments are working very nicely and every one exceedingly pleased with them. You will have all the business you can do." HOME TELEPHONE CO., Sioux City, Iowa.

"The Standard when known will knock out inferior instuments." U. J. FEE, Supt. Tel. C., M. & St. P. Ry.

"Better than any of the others we have." E. PENNINGTON, Supt. Tel. "Soo" Ry.

"Have given Standard extremely hard test where induction is heavy, with most satisfactory results. J. R. MICHAELS, Supt. Tel St. Paul & Duluth Ry.

"The Standard will transmit a whisper or a shout with equal clearness." HUMPHREY JONES, Washington C. H., Ohio.

"Their efficiency and working is perfect. We shall use nothing but Standard." GALLAGHER BROS. Meridian, Miss.

**CORRESPONDENCE SOLICITED.**

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Stickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

## THE OTTO *Gas, Gasoline and Natural Gas* ENGINES

FOR

**Electric Lighting.**

Sizes 2 to 250 H. P.

Electric Light Plants in Operation from 2 to 250 H. P.

**The Otto Gas Engine Works,**
**PHILADELPHIA.**

## The Clonbrock Steam Boiler Co.,

**BROOKLYN, N. Y.**

Manufacturers of the

**Morrin "Climax" and "Compound" Safety Water Tube Boilers.**

**BUILT IN UNITS OF 50 TO 1000 H. P.**

ALSO BUILDERS OF

**Smoke Stacks, Tanks, Etc., and All Classes of Iron Work.**

**Specifications, drawings and prices furnished on application.**

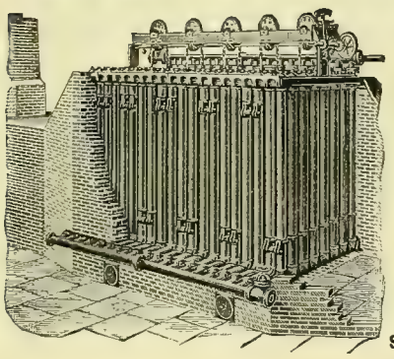
**Send for Catalogue of Climax and Compound Boilers.**

THE HUSTON PATENT **BOILER BRACE**

Is pressed from a solid piece of best Flange Boiler Steel. No welds.
***Stronger, Stiffer and Lighter than Iron.***

**LUKENS IRON AND STEEL CO.,**
**Coatesville, Penna.**

WRITE FOR CIRCULAR. PHILA OFFICE, 402 Bullitt Building. NEW YORK OFFICE, 29 Broadway.



## Save Money and Economize

BY USING

**GREEN'S ECONOMIZER**

**FOR STEAM BOILERS.**

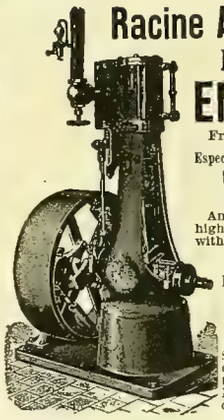
Can be applied to any type of boiler without stoppage of works.

High temperature of feedwater much above boiling point.

**Catalogues, Plans and Specification on Application.**

**SOLE MAKERS IN THE UNITED STATES.**

## Racine Automatic HIGH SPEED ENGINES.



From 1 to 125 H. P.

Especially Adapted for **ELECTRIC LIGHTING,**

And all places where high speed in connection with economy is desired.

Over 2,500 in use.

Porcupine and Tubular **BOILERS.**

MARINE ENGINES AND OUTFITS.

Send for Catalogue describing our new 1 to 6 H. P. Automatic Engine and Boiler outfit.

**Racine Hardware Co.,**
W. F. PARISH, Gen'l Sales Manager,
W, Marquette Building,
Works, Racine, Wis. CHICAGO, ILL., U. S. A.

## THE MANISTEE IMPROVED STEAM PUMP

For Every Possible Service.
Reliable and Durable.
Excelled by None.
Automatically Governed.

**MANISTEE.... IRON WORKS CO.,**
MANISTEE, MICH.

**Western Agents:**
**WESTERN VALVE CO., Chicago, Ill.**

## THE FUEL ECONOMIZER CO.,

**MATTEAWAN, N. Y.**

CHICAGO OFFICE, 1540 MARQUETTE BLDG.

## ROOT IMPROVED WATER TUBE BOILER.

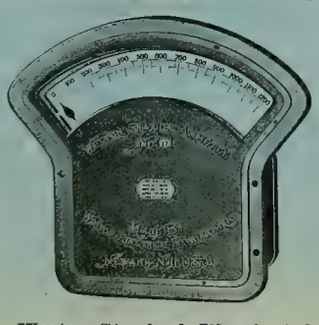
## WESTON Electrical Instrument Co.,

114-120 William St, NEWARK, N. J., U. S. A.

### Illuminated Dial Station Instruments.

These instruments are based upon the same general principle and are just as accurate as our regular Standard Portable Direct Current Voltmeters and Ammeters, but are much larger, and the working parts are inclosed in a neatly designed dust-proof cast-iron case which effectively shields the instruments from disturbing influences of external magnetic fields.



Weston Standard Illuminated Dial Station Voltmeter. Style B. "Flush Type."

### Weston Standard

Portable Direct Reading Voltmeters and Millivoltmeters. Ammeters and Milammeters. Wattmeters and Voltmeters, for Alternating and Direct Current Circuits.

Our portable instruments are recognized as standards throughout the civilized world.

Our Semi-Portable Laboratory Standard Voltmeters and Ammeters are still better.

They are the most reliable, absolute standards for Laboratory use.

Mention the WESTERN ELECTRICIAN when writing for catalogues.

## Packard Lamps

are the only lamps which give full candle power at initial efficiency after burning six-hundred hours. This we guarantee.

# The Herald of a New Era:

"Interior Conduit had to fight its way, to overcome criticism and opposition; but to-day it has the endorsement of the underwriting bodies of America, and is being rapidly introduced all over Europe."—*Electrical Engineer.*

**In addition** to plain, brass and iron armored conduit for use in buildings, there has been added **Iron Armored Underground** Conduit. This is made in lengths most convenient to handle, and when laid gives a continuous, telescopic insulating tube, without sleeves or joints, and **iron armored** its entire length. As it is air and moisture proof, conductors with light insulation, or *no* insulation can be used—watertight hand and man-holes made to suit requirements of each case.

We carry all tools and accessories necessary for the complete installation of Conduit work. Contractors not fully understanding the usual methods of Conduit work are invited to confer with us. We will cheerfully give every aid possible. Send us tracings or blue prints of buildings in which it is desired to introduce the system, and we will "lay out" the work, so that there can be no possible misunderstanding, also furnish list and prices of material needed, enabling you to make an intelligent and profitable estimate. Correspondence promptly answered.

## In your town

there must be a printing office, or laundry, machine shop, or some user of light power that would be glad to displace an unsatisfactory, unsafe and unclean engine and boiler combination with a **Lundell Motor,** if they only knew how easily they could do it.

**Have you told them?** Get Smith to put in a motor. And Jones, and Greene, and Brown, and Smythe will not rest until they have one too. It's infectious. You'll be busy.

# THE ONLY REFLECTOR PLATE ALTERNATING ARC LAMP.

## The Helios Electric Company claims:

That they have more alternating arc lamps in use than all other makes combined.
They guarantee 80 per cent. more available light than is obtained from any other alternating arc lamp.
They guarantee to give as much light as any direct current lamp using the same number of watts.

# SPENCER'S IMPROVED ALTERNATING ARC LAMP

## Possesses the following advantages:

Minimum choke in the regulating coil.
Practically no energy absorbed in the regulating device.
Durability of all its parts; not liable to get out of order.
Can be used successfully on all periods.
Starts quickly.

# SPENCER'S DIRECT CURRENT CONSTANT POTENTIAL LAMP.

## Guaranteed not to see-saw.

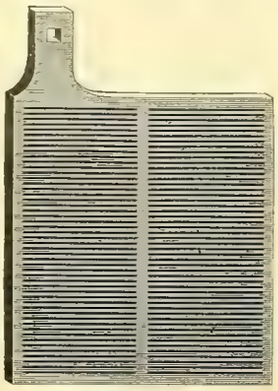
# STORAGE BATTERIES.

UNFORMED PLATE.

Our Plate is made from one integral piece of rolled virgin lead, without joints, solder or applied active material or paste. After being prepared by sawing it is put through an electro-chemical process by means of which the interstices become completely filled with oxide of lead

## FORMED FROM THE PLATE ITSELF,

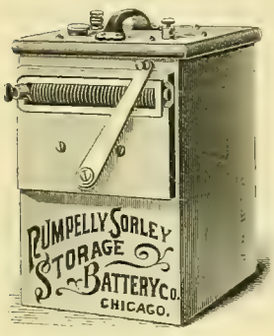


FORMED PLATE.

it thus having the same chemical purity as the Plate or supporting grid. Under the above method of manufacture, fully protected by our patents, we have produced the

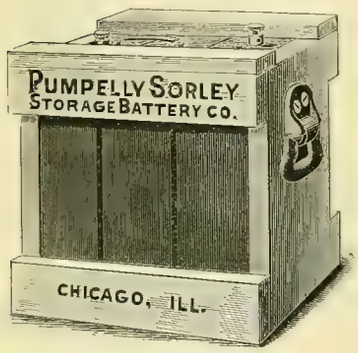
## FIRST INTEGRAL SLOTTED ROLLED LEAD

Storage Battery Plate, and one which has shown a marked advantage in efficiency and life over any form of cast lead or grid.



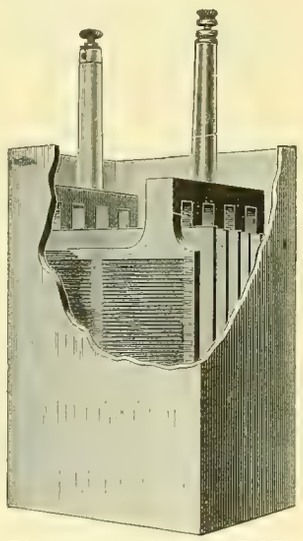
PHYSICIAN'S CELL.

Our Portable Phonograph and Physician's Cells have almost completely displaced all other types of Batteries in the West.



BOAT CABINET.

Our Portable Electric Boat Outfits are in use by many sportsmen, tourists and pleasure seekers.



INTERIOR OF PORTABLE CELL.

TELEPHONE CABINET.

Our **Telephone Cabinets** are used extensively by the **Chicago Telephone Co.** and others, and our small telephone cabinets are rapidly displacing primary batteries in telephone service. Our central station cells are used in many Western plants, and are now being installed in the **Chicago Board of Trade,** and the best evidence of our success in our own territory lies in the fact that **threatenings of injunctions** are beginning to be made to our customers. But we wish to assure them that we not only own all patents covering the manufacture of our own battery, but **control the use of Asbestos, Cellulose or wood pulp fibre between** the plates of storage batteries, and **will protect our customers against all suits for infringement.**

**Write for Prices and Estimates.**

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems.
Colored Glass Insulators to designate different currents.

WORK ON SPECIAL DESIGNS A FEATURE.

THE

# "CLARK" WIRE.

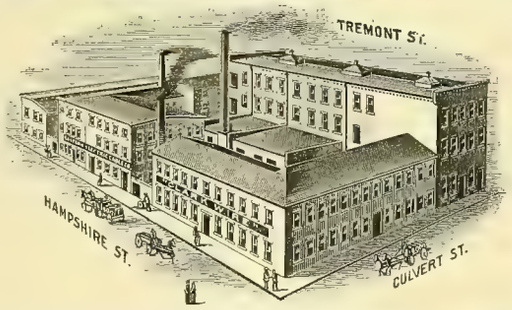
TRADE MARK.

For Switchboard, Railway and Motor use, we make all sizes of Stranded and Flexible Wire and Cables with Clark's Insulation.

The Clark Wire has been before the public and in use for the past nine years, and has met with universal favor. Thousands of miles of this wire have been sold, and are in use throughout the United States and Foreign Countries, and the demand for it is constantly increasing, because it always gives perfect satisfaction.

**BRANCH OFFICE:**

1649, 1650, 1651 MONADNOCK BLDG.,
CHICAGO, ILLINOIS.



**In a Letter from the Inspector of the Boston Fire Underwriters' Union, he states: "A Thoroughly Reliable and Desirable Wire in every respect."**

The Rubber used in insulating our Wires and Cables is especially chemically prepared, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat.

We guarantee our Insulation wherever used, Aerial, Underground or Submarine, and our net prices are as low, if not lower, than any other first-class Insulated Wire.

We shall be pleased to mail Catalogues with Terms and Discounts for Quantities.

## LOCATIONS FOR INDUSTRIES.

The name of the Chicago Milwaukee & St. Paul Railway has long been identified with practical measures for the general upbuilding of its territory and the promotion of its commerce, hence manufacturers have an assurance that they will find themselves at home on the Company's lines

The Company has all its territory districted in relation to resources, adaptability and advantages for manufacturing, and seeks to secure manufacturing plants and industries where the command of raw material, markets and surroundings will ensure their permanent success.

Mines of coal, iron, copper, lead and zinc, forests of soft and hard wood, quarries, clays of all kinds, tanbark, flax and other raw materials exist in its territory in addition to the vast agricultural resources.

The Chicago, Milwaukee & St. Paul Railway Company owns and operates 6,168 miles of Railway, exclusive of second track, connecting track or sidings The eight States traversed by the Company, Illinois, Wisconsin, Northern Michigan, Iowa, Missouri, Minnesota, South Dakota, and North Dakota, possess, in addition to the advantages of raw material and proximity to markets, that which is the prime factor in the industrial success of a territory—a people who form one live and thriving community of business men, in whose midst it is safe and profitable to settle.

A number of new factories and industries have been induced to locate—largely through the instrumentality of this Company—at points along its lines. The central position of the States traversed by the Chicago, Milwaukee & St. Paul Railway, makes it possible to command all the markets of the United States. The trend of manufacturing is westward. Confidential inquiries are treated as such. The information furnished a particular industry is reliable. Address,

**LUIS JACKSON,**
Industrial Commissioner, C. M. & St. P. R'y,
425 Old Colony Building, CHICAGO, ILL.

**HAVING MOVED INTO OUR NEW QUARTERS AT 250-4 SOUTH CLINTON STREET, CHICAGO, WE ARE NOW**

# The Largest Manufacturers of Telephone Apparatus

**AND APPLIANCES, EXCLUSIVELY, IN THE WORLD.**

**WE BELIEVE** in producing Apparatus which is Strictly Non-Infringing, and frown on patent pirate concerns.

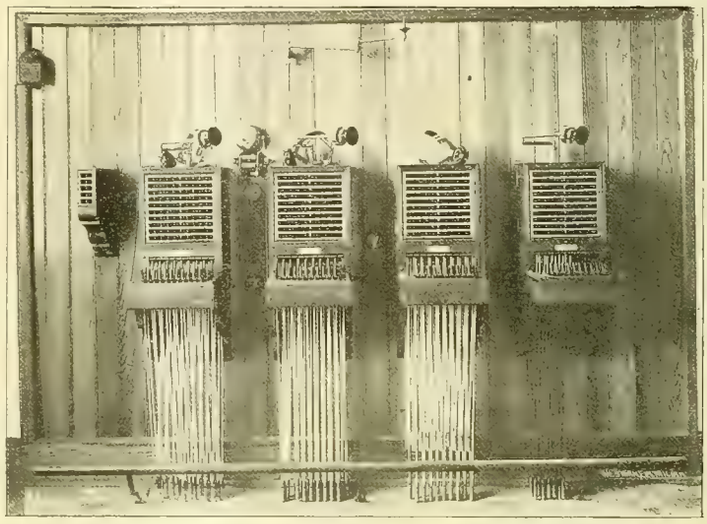
## OUR NEW LONG-DISTANCE MICROPHONE (BATTERY) TELEPHONE

Is as much superior to any other type of Microphone (Battery) Telephone as our No. 1 Magneto Telephone was to all other magneto 'phones.

The New Exchanges at Newark, O., Johnstown, Pa., Oskaloosa, Ia., and Lansing, Mich., each using about 400 of these instruments, we claim to be

### The most Perfect Exchanges of their size in the United States.

The Superiority of Service and Economy of Operation afforded by them have practically resulted in transferring the business from the Bell system to the Western in these cities, notwithstanding the Bell offer of one-half rates.



**Chillicothe, Ohio, "Western" 400 Telephone Exchange.**

### THE INTERIOR DEPARTMENT, WASHINGTON, D. C.,

After the most exhaustive examination, tests and trials for telephones ever made, awarded this Company the contract at almost double the price for apparatus of the next highest bidder. The expert committee which made the examination stated:

> "The Western Telephone Construction Company stood above the others, also it was found that not only were the "Switchboards proposed to be furnished by the Western Telephone Construction Company free, as far as your "committee are at present aware, from infringement of any patent not owned by that company, but that they embody "all recent improvements in that line."

**Nearly 100 are in use in the U. S. Patent Office, displacing Bell system.**

## MANUFACTURING EVERYTHING

Necessary for the complete equipment of a Telephone Exchange, we can assure those who contemplate purchasing instruments that they will save time and money by dealing directly with us, as we have ample facilities, and have had abundant experience in all departments of telephone work.

# WESTERN TELEPHONE CONSTRUCTION COMPANY.

☞ **NOTE.**—Beware of the falsehoods and misrepresentations of competitors who dare not give a public list of their exchanges, but pretend to have "letters, etc.," which they show. Write direct to parties and ascertain the truth!

# THE TELEPHONE HAND-BOOK

**BY HERBERT LAWS WEBB.**

*Member of the American Institute of Electrical Engineers, and of the Institution of Electrical Engineers, London. Author of "A Practical Guide to the Testing of Insulated Wires and Cables." Joint Author of "Electricity in Daily Life."*

## 146 Pages, 138 Illustrations, Cloth, Hand-Book Size, Price $1.00.

EXTRACT FROM PREFACE.

"This little book has no pretension to be considered a complete treatise on telephony as it exists in America. The time for such a work is not yet come. But it is felt that there is a demand for a practical book on telephone working and management, and THE TELEPHONE HAND BOOK is an attempt at meeting that demand. With the exception of a few chapters dealing with certain forms of transmitters and receivers used in Europe, which are given for the information of those who may wish to engage in the manufacture of telephones, the book is based entirely on standard American practice; and most of the material, apparatus and methods described are peculiar to or have originated in this country."

No pains have been spared to make it the best book of its kind. It is right up to date, intensely practical, and so plain and clear in its language that any one can understand and learn from it everything regarding telephone work and management. It conforms in size and style to our other Hand-Books which have been so favorably received by the entire electrical fraternity.

CONTENTS.

CHAPTER 1. The Invention of the Telephone.
2. Sound Waves. Articulate Speech.
3. Electric Telephony. The Bell Telephone.
4. The Microphone.
5. Current Induction. Electromagnetic Induction.
6. The Induction Coil: its Use in the Telephone Transmitter.
7. The Complete Telephone Circuit.
8. Magnet Telephones.
9. The Bell Telephone Receiver
10. Other Forms of Magnet Telephones.
11. The Gower, Ader and D'Arsonval Receivers. Mercadier's Bi-Telephone.
12. The Siemens, Kotyra, Neumayer and Böttcher Receivers.
CHAPTER 13. Carbon Transmitters.
14. The Blake Transmitter.
15. The Long Distance Transmitter.
16. The Solid-back Transmitter.
17. The Berliner Transmitter.
18. The Cuttriss Transmitter.
19. Various European Transmitters.
20. The Efficiency of Carbon Transmitters.
21. Batteries for Telephone Work.
22. Open Circuit Batteries.
23. Closed Circuit Batteries.
24. The Practical Management of Batteries.
25. Magneto Bells.
26. Automatic Switches.
27. Telephone Line Construction.
CHAPTER 28. Metallic Circuits.
29. Underground Wires.
30. Lightning Arresters.
31. Inside Wiring.
32. Installation of Telephone Instruments.
33. Inspection and Maintenance.
34. The Condenser: its Use in Telephony.
35. Electromagnetic Retardation.
36. Exchange Working.
37. Small Exchanges.
38. Party Lines: The Bridging Bell.
39. Long Distance Telephony.
40. Duplex Telephony.
41. Simultaneous Telegraphy and Telephony.
Appendix.

**TESTIMONIALS.**

We submit among hundreds of others the following testimonials, and call attention to the fact that they are from expert electricians, managers of exchanges and superintendents of railroad telegraph.

"A whisper is distintly heard. We pronounce the Standard perfect." STEELE CO. (N. D.) TEL. CO.

"We talked to Rowell, 75 miles, through storm induction. Have discarded the Bell for Standard." PECOS IRRIGATION & IMP. CO., Eddy, New Mexico.

"Have used Cushman, Harrison and Bell, but consider the Standard far superior." C. A. ROOD, Reedsburg, Wis.

"I should recommend Standard to our people as against any other with which I am familiar. The test we gave was between St. Paul and Dickinson, 559 miles." O. C. GREENE, Supt. Telg. Northern Pacific Ry.

"Your instruments are working very nicely and every one exceedingly pleased with them. You will have all the business you can do." HOME TELEPHONE CO., Sioux City, Iowa.

"The Standard when known will knock out inferior instuments." U. J. FRY, Supt. Tel. C., M. & St. P. Ry.

"Better than any of the others we have." E. PENNINGTON, Supt. Tel. "Soo" Ry.

"Have given Standard extremely hard test where induction is heavy, with most satisfactory results. J. R. MICHAELS, Supt. Tel. St. Paul & Duluth Ry.

"The Standard will transmit a whisper or a shout with equal clearness." HUMPHREY JONES, Washington C. H., Ohio.

"Their efficiency and working is perfect. We shall use nothing but Standard." GALLAGHER BROS. Meridian, Miss.

**CORRESPONDENCE SOLICITED.**

## Directory of Principal Electrical and Mechanical Engineers.

B. J. Arnold, Mem. A. I. E. E.
Consulting Electrical Engineer.
SPECIALTY:
Electric Railways and Power Stations.
**1541 Marquette Bldg., Chicago.**

William H. Bryan, M. Am. Soc. M. E.
Mechanical and Electrical Engineer.
Consultations, Reports, Estimates, Plans, Specifications, Superintendence, Tests, Purchasing.
Designs of Central Stations a Specialty.
**Turner Building, St. Louis.**

LOUIS E. WALKINS,
Consulting Engineer and Designer of Power Stations and Electrical Equipment.
Proprietor of Practical Systems of Permanent Overhead Rapid Transit Trolley, Electrical Canal Boat Propulsion, Underground Conduits, Electric Governor and Meters
Electric railways examined, and reports made for capital.
Correspondence solicited. **Office and address, 30 Court St., Boston.**

J. FRANCIS SMALL, Prop'r.
**Chicago Electro-Mechanical Enterprise Co.,**
Designers, Draughtsmen and Contractors
OF ANY
**Machinery or Appliances in Mechanics and Electricity.**
Suite 1339-1340 Monadnock Block, CHICAGO.
We make drawings for anything.
We invent to order.
We solicit patent causes.
We are in a position to interest Capital in any device of merit.
What have you?
Write or call at our office.
All communications strictly confidential.
Patent Office Work a Specialty. Consulting Engineer. New Inventions Developed.

Forée Bain, Electrical and Mechanical Engineer.
Consulting, Designing, Superviding, Constructing, Testing.
Plans, Specifications and General Engineering.
Expert in Patent Causes.
Suite 1657, 1658 and 1659 Monadnock Building, CHICAGO.

O. P. SELLS,
ELECTRICAL ENGINEER,
EXPERT
IN ELECTRICAL CONSTRUCTION.
PLANS, SPECIFICATIONS AND SUPERVISION.
Hennen Building, New Orleans.

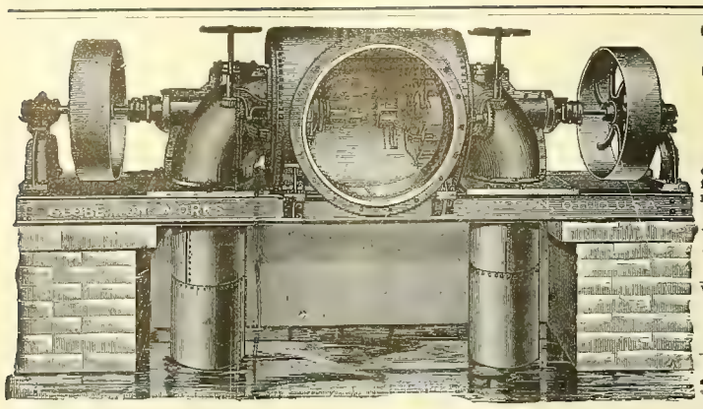
All Offices of the Westinghouse Electric & Mfg. Co. And All Foreign Countries.



# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke, Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.

The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

| | Head. | Rev. per Min. | Cu. Ft. per Sec. | Horse Power. | P'r Cent |

**OFFICES IN ALL PRINCIPAL CITIES.**

# The Choice of Transformers.*

**BY PROF. D. C. JACKSON, C. E.**

Member of the American Society of Mechanical Engineers; Member American Institute of Electrical Engineers; Professor of Electrical Engineering, University of Wisconsin, Madison, Wisconsin.

* * * "In order to place before you independent data representing all the American "transformers of moderate capacities, I will give the results of a long and carefully carried "out series of tests made by A. H. Ford in the laboratory of the University of Wisconsin. "For these tests transformers of fifteen hundred watts capacity, as nearly as possible, were "procured directly from the manufacturers within about a year from this date, so that the "tests may be presumed to represent the latest and best designs which are now supplied. "These transformers are from the most prominent makers, and, in fact, include all impor- "tant makes of American transformers, with two or three exceptions.

"The results of the tests are given in the attached table.

| Number. | Watts Capacity. | Open Circuit Current. | | Watts Iron Loss. | | Watts Copper Loss Full Load. | Total Pressure Drop. | Efficiencies. | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | Full Load. | | All Day. | |
| | | *f* 125 | *f*-60 | *f*-125 | *f*-60 | | | *f*-125 | *f*-60 | *f*-125 | *f*-60 |
| 1 | 1250 | .043 | .066 | 37 | 48 | 30 | 2.5 | 95 | 94 | 85 | 83 |
| 2 | 1500 | .076 | .124 | 50 | 71 | 45 | 3.5 | 95 | 94 | 85 | 81 |
| 3 | 1500 | .052 | .100 | 32 | 46 | 38 | 4.0 | 96 | 95 | 89 | 85 |
| 4 | 2500 | .230 | .540 | 135 | 230 | 44 | 2.5 | 92 | 89 | 77 | 68 |
| 5 | 1800 | .076 | .600 | 53 | 109 | 67 | 5.0 | 94 | 92 | 85 | 75 |
| 6 | 2000 | .055 | .091 | 42 | 56 | 55 | 5.0 | 95 | 94 | 89 | 86 |
| 7 | 1000 | .028 | .064 | 24 | 28 | 53 | 3.0 | 95 | 94 | 87 | 86 |
| 8 | 1500 | .073 | .113 | 57 | 76 | 31 | 2.5 | 94 | 93 | 83 | 79 |
| 9 | 1500 | .077 | .144 | 43 | 55 | 28 | 3.0 | 95 | 95 | 86 | 84 |

**"These results, I find, do not differ very widely from those published by the Fort Wayne "Electric Corporation in a small blue-printed pamphlet, which, however, contains tests made "by the company upon only a few of the makes of transformers included in my table."**

**The transformer marked No. 1 in the above table, is a twenty-five light transformer of the Fort Wayne Electric Corporation's make.**

*Abstract from a paper read before the Northwestern Electrical Association at the summer meeting, held in Chicago, July 17, 18 and 19.

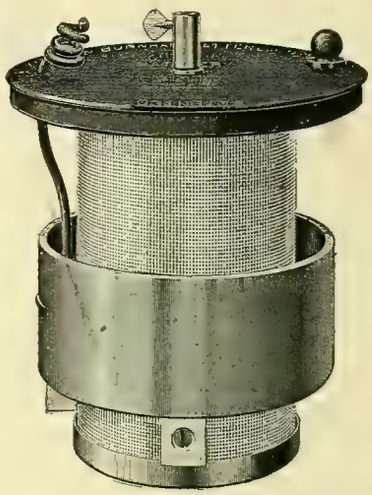
# GORDON PRIMARY BATTERY

## EXCELS IN:

1. **LONG LIFE.**—Warranted to operate, at a discharge rate of eight or ten one-hundredths of an ampere, six months without any attention whatever, as required for Railway Signal Service, and much longer where less power is required.
2. **EFFICIENCY.**—It will perform many kinds of work that cannot be obtained from the Gravity Battery.
3. **ECONOMY.**—The installations and maintenance of the Gordon Battery for one year for Railway Signal Service is about one-half the cost of the Gravity Battery.
4. **ADAPTABILITY.**—The Gordon Battery will work equally well on either open or closed circuit.
5. **IT IS ABSOLUTELY NON-FREEZING.**—In practical operation in Railway Signal Service, the Gordon Battery on the surface of the ground has worked uninterruptedly, with the mercury four degrees below zero. Gravity Batteries at the same station, eight feet under ground, at the same time, froze solid.
6. **LABOR SAVING.**—It requires no supervision whatever during its life.
7. **FREE FROM LOCAL ACTION.**—It is not consumed by local action when not in service. Gravity Batteries require constant attention and "feeding," whether in use or not, while the Gordon Battery is not a self-consumer, all its elements remaining intact until required to produce power.
8. **FREEDOM FROM GASES AND ODORS.**—It is clean and neat in appearance, and absolutely free from noxious fumes and gases, and "creeping" salts.
9. **SUPERIOR GENERATION OF ENERGY.**—Its product in useful energy is four times greater, weight for weight, than the Gravity Battery.



These Batteries are in use by the most prominent Telephone, Fire Alarm and Railroad Companies of America.

Send for descriptive circular and price list.

We guarantee all our Cells.

**Manufactured by**

## THE GORDON-BURNHAM BATTERY CO.,

No. 82 West Broadway, NEW YORK.

---

## Giant Strain Insulators.

Insulated with **Moulded Mica.** Hangers, Pull-Overs, Feed-Wire Insulators, Frogs, Section Insulators, etc.

**VULCABESTON CONTROLLER REPAIR PARTS.**

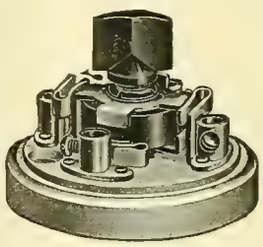
**H. W. JOHNS MFG. CO.,**

240-242 Randolph St., Chicago.

NEW YORK. PHILADELPHIA. BOSTON.

## HART SNAP SWITCHES!

**STANDARD SWITCHES, 5 and 10 ampere S. P.**
**10 amp. 3 and 4-way, 10, 15, 30 and 50 amp. D. P.**



## FLUSH SWITCHES

Of any of the above sizes, either on single plates or with any number of switches upon one plate.

***Cut illustrates 4-way or commutation switch, controls a light or group of lights from any desired number of points.***

## Central Electric Company,

173-175 Adams Street, CHICAGO.

Western Agents: Okonite Wire, Interior Conduit, Lundell Motors.

# THE ONLY REFLECTOR PLATE ALTERNATING ARC LAMP.

## The Helios Electric Company claims:

That they have more alternating arc lamps in use than all other makes combined.
They guarantee 80 per cent. more available light than is obtained from any other alternating arc lamp.
They guarantee to give as much light as any direct current lamp using the same number of watts.

# SPENCER'S IMPROVED ALTERNATING ARC LAMP

## Possesses the following advantages:

Minimum choke in the regulating coil.
Practically no energy absorbed in the regulating device.
Durability of all its parts; not liable to get out of order.
Can be used successfully on all periods.
Starts quickly.

# SPENCER'S DIRECT CURRENT CONSTANT POTENTIAL LAMP.

## Guaranteed not to see-saw.

# CENTRAL STATION SUPPLY CONTRACTING STREET RAILWAY MEN!!

DEAR SIRS:—As the Fall and Winter seasons are now approaching, permit me to call your attention to an exceptional opportunity for the purchase of ARC LAMPS and CARBONS. The goods which I am offering **must be sold to close an estate** and I can offer them at figures which cannot be duplicated in the electrical trade.

These goods are of STANDARD MAKES, ENTIRELY NEW and in PERFECT ORDER, and the offer will not remain open long. They consist of STANDARD "WARD" ARC LAMPS FOR DIRECT AND ALTERNATING Current Circuits; also Series, Focusing, Double Carbon and Railway "WARD" Lamps. The "WARD" Lamp is the Arc Lamp which built up the business of Arc Lighting on Incandescent Circuits, and more of them have been sold than of all the other makes in this country.

I can offer also the "KNIGHT" ARC LAMP for both DIRECT and ALTERNATING Current Circuits, for series and railway work, and twin lamps. "Knight" Lamps are offered by several other parties, but it is not possible for them to give the low prices I quote.

I have also a large stock of FOREIGN and DOMESTIC CARBONS of the following types:

## Foreign--SIEMENS, LACOMBE, HARDTMUTH AND SHIP CORED.
## Domestic--NATIONAL, FIDELITY, SOLAR AND GLOBE.

Write me at once, stating kind, size and quantity you desire. Yours truly,

**CHAS. H. WATERMAN,** 1305 HAVEMEYER BUILDING, 26 Cortlandt St., NEW YORK.

**Sales Agent for Wm. T. Hammer and John F. Randolph, Assignees for Francis R. Upton.**

**IF** you are anxious to secure the latest electrical books, **YOU** should write to the Electrician Publishing Co., Chicago. You **CAN'T** procure too many reliable, readable books to **READ.**

# THE ELECTRIC STORAGE BATTERY COMPANY

## OF PHILADELPHIA, PA.,

In addition to all American Patents heretofore controlled, has recently acquired from the

## Accumulatorem-Fabrik Aktien-Gesellschaft,

OF HAGEN (IN WESTPHALIA), PRUSSIA.

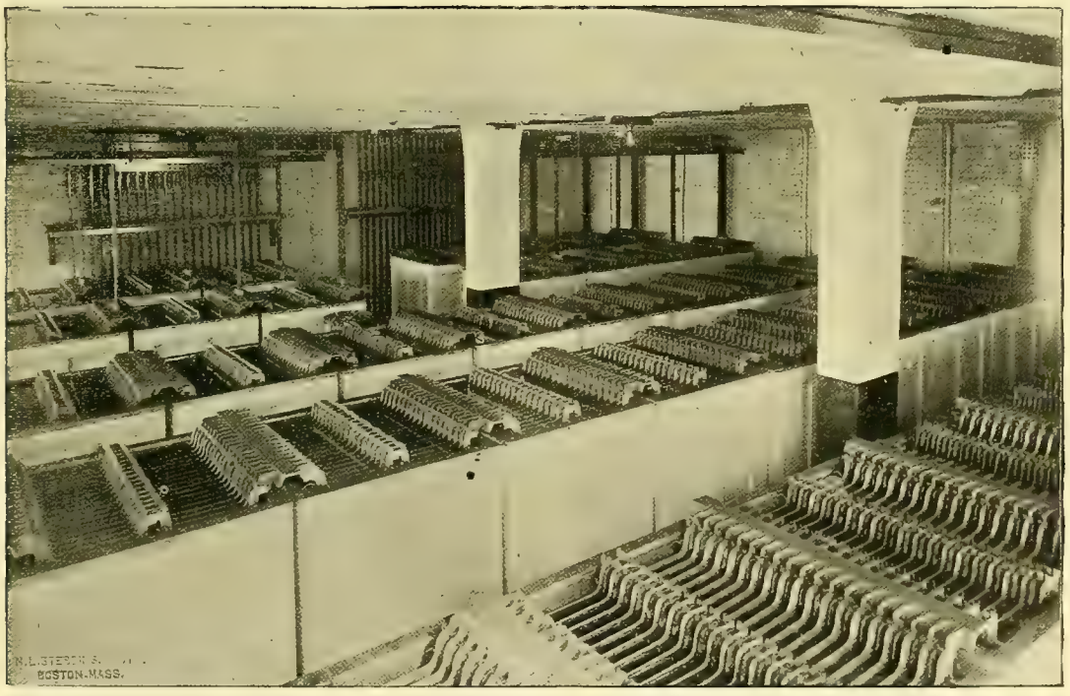
All patent rights for the exclusive manufacture of

## Tudor Storage Batteries

in the United States, and is prepared to furnish Batteries of this type of any desired size.

**In Germany and Austria** the TUDOR BATTERY is used in eighty per cent. (80%) of all Central Stations—besides being installed in

## 15 RAILWAY POWER PLANTS and 5000 ISOLATED LIGHTING PLANTS.



TUDOR STORAGE BATTERIES—BOSTON EDISON STATION.

**Storage Batteries are Needed in Central Stations:**

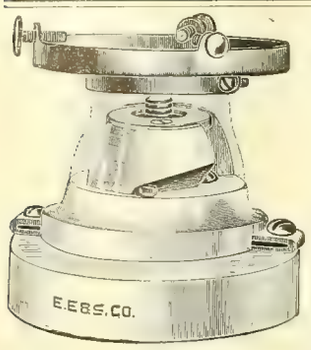
**1st.** To effect reduction in first cost of plant. (Half steam power plant and half Storage Battery Plant costs only three-quarters of what all Steam Plant would cost for same work.)
**2d.** To convert variable into steady loads. This will save machinery from strain.
**3d.** To effect a saving of from 20 per cent. to 40 per cent. in coal bills.
**4th.** To insure reserve power in case of accident to generating machinery.

For particulars address,

# The Electric Storage Battery Company,

Sole Manufacturers of the "CHLORIDE ACCUMULATOR,"

**PHILADELPHIA, PENNSYLVANIA.**



# E. E. & S.

## RECEPTACLE FOR SHADE HOLDER.

Double pole. Easily fused. No wiring to the socket. Contact made direct on the rosette ears. Top porcelain is interchangeable, and will fit any one of our different styles of rosette bases.

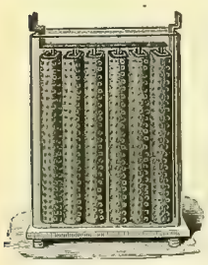
# The Ohio Storage Battery Company,



**Sole Manufacturers, under Exclusive License, of the Ford-Washburn Storelectro Co.'s Storage Batteries:** **The most durable Batteries ever produced. For Street Railways, Lighting Plants, Electric Launches, Electric Carriages, Doctors and Dentists; and for any other work where Storage Batteries can be used.**

**SPECIALTIES:** Isolated Plants for house lighting, and cells for surgical, telegraph, telephone and phonographic uses. Small cells made to order. Send for catalogue giving capacities, weights, etc.

**MAIN FEATURES OF THE CELL:** **The ability to stand an incessant charge and discharge without any injury, which is an advantage that cannot be exaggerated; the capability of enduring a repeated discharge on a dead short circuit without injury to the cells; the special form of cell which frees it from the weaknesses that have made other types a failure.**

**EASTERN OFFICE: 203 Broadway, New York City. J. A. MACHADO, Agent.**

THE OHIO STORAGE BATTERY CO., 52 WADE BUILDING, CLEVELAND, OHIO, U. S. A.

# NOTICE!

The Siemens & Halske Electric Company of America, as the owner of United States patents of Siemens & Halske, Berlin, makes the following announcement:

The firm of Siemens & Halske, Berlin, was established by the late Dr. Ernst Werner von Siemens in 1848, and has ever since been the pioneer in all branches of electrical work.

In 1867 Dr. Siemens built the first dynamo electric machine, and gave it the name, "dynamo electric machine," by which it is now universally known. The well-known Siemens armature for dynamo electric machines was the invention of Dr. Siemens.

In 1879 Dr. Siemens exhibited the first electric railway embodying all the modern principles of electric locomotion.

In 1878 von Hefner-Alteneck, one of the engineers of Siemens & Halske, invented the first differential arc lamp, which enabled a series of arc lamps to be used in the same circuit.

Numerous patents upon the inventions of Dr. Siemens and his assistants have been obtained in the United States, and makers, sellers and users of electrical apparatus are notified and warned to avoid infringements, as the rights secured under these patents will be protected.

Attention is particularly drawn to a few of the patents covering some of the principal articles of electrical manufacture:

| DYNAMOS AND MOTORS. | |
|---|---|
| 389,752 | September 18, 1888. |
| 395,019 | December 25, 1888. |
| 496,567 | May 2, 1893. |
| 509,662 | November 28, 1893. |
| 513,507 | January 30, 1894 |
| 520,264 | May 22, 1894. |
| 528,608 | November 6, 1894. |
| 530,114 | December 4, 1894 |

| ARC LAMPS. | |
|---|---|
| 412,141 | October 1, 1889. |
| 498,566 | May 30, 1893. |
| 506,503 | October 10, 1893. |
| 518,719 | April 24, 1894. |

| ELECTRIC MOTOR CAR. | |
|---|---|
| 322,859 | July 21, 1885. |
| 324,176 | August 11, 1885. |
| 480,310 | August 9, 1892. |
| 486,920 | November 29, 1892. |
| 490,307 | January 24, 1893. |
| 493,942 | March 21, 1893. |
| 493,943 | March 21, 1893. |

| TROLLEY STAND and TROLLEY. | |
|---|---|
| 487,813 | December 13, 1892. |

| 509,421 | November 28, 1893. |
| 520,356 | May 22, 1894. |
| 530,286 | December 4, 1894. |

| 3 and 5 WIRE SYSTEMS. | |
|---|---|
| 497,755 | May 16, 1893. |
| 501,095 | July 11, 1893. |
| 542,979 | July 16, 1895. |

No. 417,668, December 17, 1889, is a patent on what is usually termed to-day, "THE DIRECT-CURRENT BOOSTER." This is a fundamental patent, and covers every known construction of boosters. Its use is extending every day in lighting and railway stations throughout the country.

A number of corporations and users of our apparatus and methods have taken licenses, and are now paying us royalties under our patents.

We are prepared to furnish apparatus, licensed under the patents mentioned above, and under numerous other patents already issued, and others soon to be issued, and shall be pleased to communicate with prospective customers concerning licenses under any of our patents.

## No. 11 DOUBLE GROOVE PONY INSULATOR.

**Can be Used for Transposing.**

The points or teats on the lower rim of the petticoat attracts the water on the outer surface of the insulator into drops. The water drops from these points on to the cross-arm, thereby preventing the moisture from creeping up on the inner petticoat, and thence to the pin. Owing to the great success of our Patent Teat Insulator in Telegraph Work, where the efficiency of the Insulator has proven to be more than twice that of the ordinary Insulator, we have concluded to apply the device to all Insulators for Telegraph, Telephone and Street Railway Work.

Standard Screw Glass Insulators,
Floor Insulators, Glass Break Knobs, Battery Jars, Arc Light Globes for all Systems,
Colored Glass Insulators to designate different currents.

WORK ON SPECIAL DESIGNS A FEATURE.

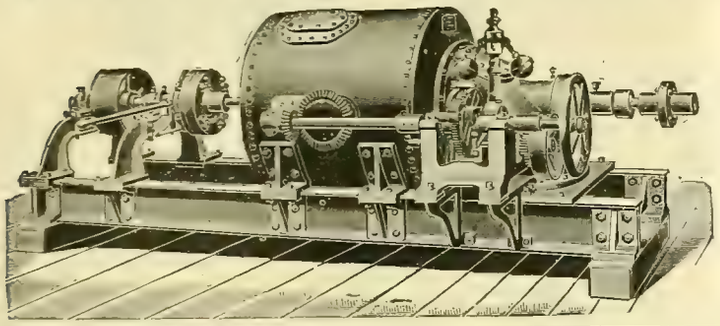
# VICTOR TURBINE WATER WHEEL.



Cylinder or Register Gate—Close Regulation and High Efficiency at Full and Partial Gate.

The attention of ELECTRIC COMPANIES is called to this **CELEBRATED WATER WHEEL** as particularly adapted to their use, on account of its **remarkably steady motion, high speed and great efficiency and large capacity** for its **diameter,** being **double** the **power** of most wheels of the same diameter. It is used by a number of the leading electric companies with great satisfaction. In the economical use of water it is without an equal, producing the highest per cent of useful effect **guaranteed.**

***SEND FOR CATALOGUE AND PARTICULARS.***

The accompanying engraving represents a single 10-inch Victor Turbine on horizontal shaft to develop 36 H. P. under 38 feet head. Arranged with 12-inch Worrell Friction Coupling at one end to disconnect pulley.

We are now prepared to furnish Victor Turbines, either single or in pairs, on horizontal shafts, and where the situation admits of their use we recommend them.

completely encloses the coil. The two poles are magnetically insulated from each other by the wooden case, to the upper part of which the diaphragm is

48 TELEPHONE HAND BOOK.

appeared on the scene with an application for a patent on a microphonic transmitter, and according to the rules of the Patent Office no patent could be issued to any of the three until it was determined whether the Drawbaugh claim was valid or not. This was finally decided against Drawbaugh, as it was proved that the Edison carbon transmitter had been in public use for more than two years before Drawbaugh made his application for a patent, and his application was thrown out. A patent was then issued to Berliner on the broad

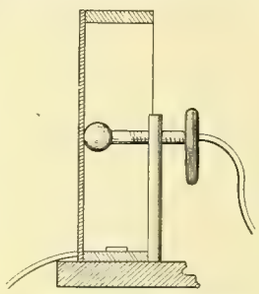

FIG. 44. BERLINER'S FIRST TRANSMITTER.

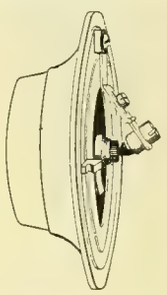

FIG. 45. BERLINER CARBON TRANSMITTER.

principle of the microphone transmitter in November, 1891. In May of the following year a patent was issued to Edison, so that both sides of the interference eventually got their patents—more than fourteen years after the filing of the original applications.

78. Both Berliner and Edison obtained in 1878 patents on special forms of transmitters designed in accordance with the principles laid down in their applications for the broad principle of battery telephones, and the Berliner transmitter especially has been modified out of all semblance to its original form. The broad claim in the Berliner patent is as follows: "The method of producing in a circuit electrical undulations similar in form to sound waves by caus-

It is Absolutely Non-Infringing.
We Guarantee Protection to All Customers

**TESTIMONIALS.**

We submit among hundreds of others the following testimonials, and call attention to the fact that they are from expert electricians, managers of exchanges and superintendents of railroad telegraph.

"A whisper is distintly heard. We pronounce the Standard perfect." STEELE CO. (N. D.) TEL. CO.

"We talked to Rowell, 75 miles, through storm induction. Have discarded the Bell for Standard." PECOS IRRIGATION & IMP. CO., Eddy, New Mexico.

"Have used Cushman, Harrison and Bell, but consider the Standard far superior." C. A. ROOD, Reedsburg, Wis.

"I should recommend Standard to our people, as against any other with which I am familiar. The test we gave was between St. Paul and Dickinson, 559 miles." O. C. GREENE, Supt. Telg. Northern Pacific Ry.

"Your instruments are working very nicely and every one exceedingly pleased with them. You will have all the business you can do." HOME TELEPHONE CO., Sioux City, Iowa.

"The Standard when known will knock out inferior instuments." U. J. FRY, Supt. Tel. C., M. & St P. Ry.

"Better than any of the others we have." E. PENNINGTON, Supt. Tel. "Soo" Ry.

"Have given Standard extremely hard test where induction is heavy, with most satisfactory results. J. R. MICHAELS, Supt. Tel. St. Paul & Duluth Ry.

"The Standard will transmit a whisper or a shout with equal clearness." HUMPHREY JONES, Washington C. H., Ohio.

"Their efficiency and working is perfect. We shall use nothing but Standard." GALLAGHER BROS. Meridian, Miss.

# Heating by Exhaust Steam,
**WITHOUT BACK PRESSURE,**
**BY THE VACUUM SYSTEM.**

ADVANTAGES.

1st.—Can be attached to existing plants at little expense.
2nd.—Effects greatest efficiency from the heating surface by the removal of the water and air, preventing water hammer and stagnant circulation.
3rd.—Saves coal by removal of back pressure from engines; water of condensation, etc.

We are owners of the patent and have equipped the largest plants in the United States; over 500 now in use. Will visit your plant and tell you how much we can benefit you, if you so desire. Send for catalogue P.

# Progress the Order of the Age.

## THE NEW AMERICAN LEADS.

Recent improvements made in the New American Turbine have increased the power as per their diameter, and produced greater efficiency from whole to half water than any other turbine, as evidenced by the following, copied from certified tests made at Holyoke Mass., on the dates named, and signed by A. F. Sickman, engineer in charge of experiments, and E. S. Waters, hydraulic engineer.
The originals of these certificates and tests of other sized wheels can be seen at our office.

**Test of a 45-inch Wheel—July 9, 1894.**

# The S. K. C. Two Phase Alternating Current System.

**THE FIRST AND ONLY COMPLETE AND PERFECTED SYSTEM BY WHICH LIGHT AND POWER CAN BE SUPPLIED FROM THE SAME GENERATOR AND CIRCUITS. POWER TRANSMISSION AND DISTRIBUTION MADE PRACTICAL AND COMMERCIALLY SUCCESSFUL.**

## POINTS OF SUPERIORITY:

Our system is much more simple and consequently more durable than any other, either direct or alternating.

Our generator is much more efficient than any other alternator, requires less attention and absolutely no supplies except lubricant for bearings.

It is practically self-regulating without the loss of energy involved by compounding or compensating. Other multiphase machines require a balance of load.

We have entirely eliminated from our generators the usual sources of trouble, expense and interruption of service: i. e., the revolving armature, commutator, collector rings, brushes, etc.

They can be built for any voltage from 110 for isolated lighting to the high voltages required for power transmission work; in latter case doing away with the expense and loss of step-up transformers; the usual central station machine can be connected at will for either 1,000 or 2,000 volts.

The motors excel in simplicity of construction; in starting torque and simplicity of starting device; in efficiency in the manner in which they take current in proportion to their load, and in uniformity of speed under different conditions of load.

Our transformers insure satisfactory service and the greatest economy. We are prepared to fill all orders promptly, and carry a full stock of transformers in Chicago.

**Patents**—Our apparatus is novel, different from anything heretofore made, and covered by patents that fully protect us and our customers. We are not infringing patents belonging to others, and shall avail ourselves of the patents under which we operate to protect ourselves from piracy by other manufacturers.

114-120 William St., NEWARK, N. J., U. S. A.

### Illuminated Dial Station Instruments

These instruments are based upon the same general principle and are just as accurate as our regular Standard Portable Direct Current Voltmeters and Ammeters, but are much larger, and the working parts are inclosed in a neatly designed dust-proof cast-iron case which effectively shields the instruments from disturbing influences of external magnetic fields.

Weston Standard Illuminated Dial Potential Indicator, Style B.

### Weston Standard

Portable Direct Reading Voltmeters and Millivoltmeters. Ammeters and Milliammeters, Wattmeters and Voltmeters, for Alternating and Direct Current Circuits.

Our portable instruments are recognized as standards throughout the civilized world.

Our Semi-Portable Laboratory Standard Voltmeters and Ammeters are still better.

They are the most reliable, absolute standards for Laboratory use.

Mention the WESTERN ELECTRICIAN when writing for catalogues.
